Rotary cutting device - for forming strips of shaped article preforms
FRITO-LAY INC 04.05.76-US-682904
P54 (04.05.76) B23d-25/12

Appts. for cutting shaped articles (e.g. preforms) from thin material (e.g. uncooked dough) is claimed.

A rotary cutter includes a first roller having a cylindrical surface with article cutters positioned around and projecting outwardly from the cylindrical surface. A second roller has trim cutters positioned around and projecting outwardly from its cylindrical surface. As the two rollers are rotated, the article cutters and the trim cutters are brought sequentially into shearing engagement to cut the material into articles and trim. Stripping fingers adjacent the outlet of the cutter bite, strip the articles and trim from the rollers for further processing.

Pref. the material is fed to the rollers as a ribbon, and the cutters cut the material into ≥1 ribbons of articles and ribbons of trim. The ribbons of articles can then be advanced for further processing and subsequent sepn. Pressurised gas streams can be used to insure the removal of trim from the edges of the first roller.

The preforms may be further processed into snack food chips. 4.5.76 as 682904 (12pp).

GROT- ★ D11 29310B/15 ★US 4145-990
Depositing grated cheese on pizza shell - by applying cheese to stationary transfer belt then moving belt
GROTE PEPP-A-MATIC 26.10.77-US-845736
P42 (27.03.79) B05c-19

Appts. for applying a coating to a food prod. e.g. cheese to a pizza includes a conveyor which advances the pizza beneath the application station. The application station has a horizontal transfer conveyor which is initially stationary and receives grated cheese in the required pattern from a grater assembly mounted above the transfer belt.

When a pizza passes beneath the application station a photodetector senses the pizza and activates the transfer conveyor to discharge the grated cheese onto the pizza as it passes beneath its discharge end. Pref. the transfer conveyor includes a scraper blade at its discharge end and the downstream roll of the conveyor is of small dia. to assist in removal of the cheese.

The shape of the cheese layer is accurately defined by the pattern applied to the transfer conveyor while stationary. 26.10.77 as 845736 (23pp295).

Dividing dough into individual portions - moved along mandril by
dies to create toroidal bagels
THOMPSON BAGEL MACH 14.11.77-US-851217 (22.02.77-US-
770694)
(03.04.79) A21c-11 A21d-06

An apparatus for forming toroidal bagels comprises an
auger which advances dough to a discharge end. At this
end the dough is typically discharged from an annular aper-
ture associated with a reciprocating cylindrical cutter
which slides over the discharge aperture to sever the
dough into product-sized pieces.

The dough pieces are received by a mandril which is
surrounded by a series of dough forming moulds. Each
mould is carried by a conveyor which moves the dough
piece along the mandril which works the dough so that at
the downstream end of the mandril the dough has assumed
a toroidal shape. 14.11.77 as 851217 (22pp295).

Salting guts to preserve them - by adding sodium poly:phosphate with a vinegar soln. contg. egg shell, sodium bi:carbonate and/or sodium hydroxide

NAKANO SU-MISE KK 06.08.77-JA-093760
(03.03.79) A23b-04/02 A23l-01/32

The method comprises adding 0.05-1% (of total wt. of salted guts) sodium polyphosphate and then adding vinegar soln. prepd. by adding egg shell, sodium bircarbonate and/or sodium hydroxide to vinegar in the ratio of acetic acid to above substance of 1:0.29-1.1 so that the acetic acid concn. in the salted guts is 0.05-0.4%. When egg shell or sodium bicarbonate is used the ratio is 1:0.6-1.1 and when sodium hydroxide is used the ratio if 1:0.29-0.53.

The preservative property of the salted guts is improved, and sourness can hardly be detected. The salt concn. in the guts can be decreased with maintaining good preservation. A delicious taste can be obtd. By adding sodium polyphosphate, sepn. of water from the salted guts can be prevented. 6.8.77 as 093760 (4pp5)

KYOW ★ D12 28598B/15 ★J5 4028-855

Improving the elasticity of marine paste foods - by adding ascorbic acid and ascorbic oxidase

KYOWA FERMENTATION KK 08.08.77-JA-094830
(D16) (03.03.79) A23l-01/32

Method for prepn. of marine pasty food by combining ascorbic acid or its salt in a pasty dough is described where ascorbic oxidase is combined in the dough.

Elasticity of marine pasty foods is important. Ascorbic acid is a known improving agent, but to give sufficient effect as much as ca. 1 wt. % is required on mashed fish meat of moisture content 80%. Now, however, effect can be intensified remarkably by adding ascorbic oxidase with the ascorbic acid (salt). Amt. of ascorbic acid can be decreased. 8.8.77 as 094830 (3pp5)

KYOW ★ D12 28599B/15 ★J5 4028-856

Prepn. of marine paste with improved elasticity - by adding tyrosinase to the dough

KYOWA FERMENTATION KK 08.08.77-JA-094831
(D16) (03.03.79) A23l-01/32

In the prepn. of marine pasty food, tyrosinase is combined in the dough.

Elasticity is an important property of marine paste foods. Tyrosinase (also called polyphenoloxidase) shows excellent improving effect on the elasticity.

Generally tyrosinase of specific activity 250 unit/mg is combined 0.002-0.02 wt.% in the mashed fish meat of moisture content 80%. When the marine pasty food having high whiteness is required, it is desirable to decrease the amt. of tyrosinase below 0.01 wt.% to avoid enzymic browning. 8/8.77 as 094831 (3pp5)

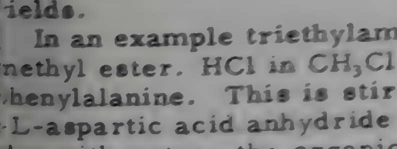
sspartyl phenyl alanine esters as sweet - ening agents
AJINOMOTO KK (SEAR) 30.04.69-JA-033349 (29.10.70-DT-053188)
*B05 E14 (05.04.79) *FR2040-473 C07c-103/52*

ower alkyl esters of α-L-asparagyl-L-phenylalanine of ormula (I) where R is lower alkyl. are prepd. by (a) reacting N-formyl-, N-benzoyl -oxycarbonyl- or N-(4-meth-oxybenzoyloxycarbonyl)-L-aspartic acid anhydride with a lower alkyl ester of L-phenylalanine in inert organ-c solvent at < 60°C; (b) the N-acyl protecting gp. of the ower alkyl ester of N-acyl-α-L-asparagyl-L-phenylaline btd. is removed in known ways and (c) (I) is isolated from he mixt.



$$H_2N\text{-}CH(CH_2COOH)\text{-}CO\text{-}NH\text{-}CH(CH_2C_6H_5)\text{-}COOR$$

(I) are known sweetening agents and are obtd. in high ields.

In an example triethylamine is added to L-phenylaline nethyl ester. HCl in CH_3Cl to give the methyl ester of L-henylalanine. This is stirred with N-benzoyloxycarbonyl -L-aspartic acid anhydride in ethylacetate. After extraction with water, the organic layer is evaporated, the residue hydrogenated to give α-L-asparagyl-L-phenylalanine nethyl ester. 29.10.70 as 053188 (5pp279)

PFIZ D13 27160Y/16 =DS 2644-621
ow-calorie flour based on modified polydextrose - contg. protein material, cellulose and natural flour
PFIZER INC 23.07.76-US-707983 (20.10.75-US-624026)
*A97 (A11 D11) (05.04.79) *BE-847-315 A23l-01/30*

A low-calorie flow substitute comprises 20-75 wt. % modified polydextrose, 2-20 wt. % proteinaceous material (as albumen, milk solids, Na caseimate, Ca caseinate, soy bean isolate, gluten or yeast), 10-40 wt. % cellulose derivs. (as α-cellulose or microcrystalline cellulose) and [illegible] rye or soy bean flow.

The polydextrose is a water-soluble, strongly branched (1,6-)having a mol. wt. of 1500-18000 and contg. (a) 0.5-5 mol. % citric, fumaric, tartaric, succinic, itaconic or malonic acid ester gps. and (b) 5-20 wt. % chemically bonded nutritions polyol (sorbitol, glycerin, erythritol, xylitol, mannitol or galacititol). It is mixed with the proteinaceous material in aqs. dispn., the cellulose deriv. and the flow added and the resulting mixt. dried. The flow is used to make doughts, pancakes and other baked products. 2.10.76 as 644621 (6pp922)

MITA ✓ D13 72836Y/41 =DS 2714-396
Precooked rice prepn. - by gelatinising surface; adding oil and/or fat and surfactant and expanding by heating compression and relaxation
MITSUI & CO LTD 02.04.76-JA-036125
*(05.04.79) *DT2714-396 A23l-01/18*

Precooked rice is produced by (a) gelatinising the surface layer of the rice granules (i.e. 25-50% of their radii) by heating with water or steam at > 65°C (> 90°C) (b) adjusting the granules water content to 8-25% by heating and then applying additives (e.g. oil either in ethanolic soln. or in aqs. suspension and (c) heating and compressing the granules and then suddenly releasing the pressure so as to expand them.

Process gives a rapidly prepa. rice prod. which has not been completely gelatinised. 31.3.77 as 714396 (6pp922)

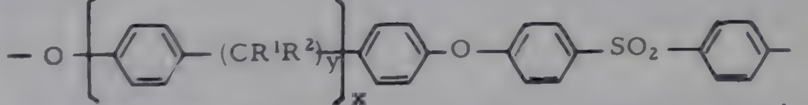
Potato crisps - made of blanched raw potato shapes made hollow with crisp skin by hot air treatment
VOGT H 26.09.77-DT-743230
(05.04.79) A23l-01/21

A new potato crisps product is made of raw potatoes which are cut into small chips, squares or spheres and are blanched at 60-80°C in water for a few minutes. Drying in hot air converts these chips into a thin crisp outer shell with a large void inside. This treatment must avoid the Maillard reaction. The final crisps are coated with flavours and aromas, pulverised meat or other tasty substances.

This creates an attractive new snack which can also be combined to resemble slices of bread. 26.9.77 as 743230 (12pp39)

DASU- ★ D13 ✓ 28122B/15 ★DT 2840-926
Anion exchanger resins for purificn. of fruit juice - based on polyaryl-ether sulphone(s) giving improved heat stability
DANSKE SUKKERFABRIK 21.09.77-GB-039276
A91 (A25 A97) (05.04.79) C08g-75/20 C13d-03/14

New anion exchange resins contain poly (aryl ether sulphone) units of formula (I).



In (I), R^1 and R^2 are H, 1-6C alkyl or phenyl; x is 1, 2 or 3; y is 0 or 1. The aromatic rings are sepd. from the SO_2 gp. by at least one aromatic ring substd. with $-C_nH_{2n}NR^3R^4$ or $-C_nH_{2n}N^+R_3R_4R_5Y^-$, in which R^3 R^4 and R^5 are 1-6C alkyl opt. substd. with OH; n is a whole number; Y^- is an anion.

Used for purificn. of sugar-contg. fruit juices contg. coloured degradation products resulting from heat treatment, and other applicns. involving heat and alkalis.

Improved heat stability is achieved with heat deformation temp. around 200°C compared with around 95°C for usual polystyrene ion exchanger resins, allowing use in hot solns. Increased resistance to hot bases used to regenerate the resin. 20.9.78 as 840926 (15pp195)

KURS ★ ✓ D13 28172B/15 ★DT 2842-266
Stable, elastic, chewable fibrous milk protein meat substitute - stabilised with aq. soln. contg. salt and aldehyde-type crosslinking agent
KURARAY KK (MNKN) 30.09.77-JA-118480
(D12) (05.04.79) A23j-03

Fibrous milk protein foodstuff contains or consists of a bundle of milk protein fibres having dia. < 10 μ, elasticity 115-380 (160-380)% and which resists 4 min. boiling in hot water at 135°C without melting.

Prodn. comprises (i) working an initial milk protein to a fibrous mass and (ii) treating the fibrous compsn. in an aq. soln. contg. (a) $\geqslant$ 1 Na-, K- and/or Ca salt in concn. $\geqslant$ 1 g. equiv./l and (b) 5-200 g/l cpd., (I) contg. an aldehyde-type gp. in which ratio mol. wt. (M) to aldehyde gp. no. (n) in mol is 120-360 (180-360). Treatment takes place at pH 2.5-6.5, 100-140 (104-140)°C, for 20 min. to 3 hrs.

The foods can replace meat, e.g. in hamburger steak prodn.

Fibrous prod. elasticity increases with M/n. Stabilisation improves chewability, elasticity and stability to boiling. In an example, stabilisation using lactose (as I) and NaCl improved chewability from 3- to 53 g/mm^2. Replacement, in control, of lactose by oxidised starch of dialdehyde type, reduced chewability from 53- to 7 g/mm^2 and elasticity from 170- to 22%. 28.9.78 as 842266 (34pp200)

UNCO- ★ D13 28191B/15 ★FR 2396-512
Treating gruyere type cheeses having a surface flora - by cooling, drying, then coating with fungistatic and emulsifying product
UNION COOP FRUITIER 08.07.77-FR-022004
A97 (09.03.79) A23c-19/16

The process for treating the cheeses having a pitted crust or a surface flora comprises (a) cooling and drying the crust followed by (b) coating it with a fungistatic and emulsifying product.

The process is applied to Gruyere, Comte, and other similar cheeses. In the case of unwrapped cheese the wt. loss is reduced from 5-9% to 1-3%, also the need for handing in cold storage is avoided in the case of wrapped ches cheese the surface marking is preserved for periods over a month. The coating mixt. pref. contains 65-80% polyvinyl acetate and 5-10% emulsifier, the pH being 3-4. 8.7.77 as 022004 (8pp597)

CARL- D13 12571A/07 =GB 1544-194
Appts. for removing chocolates from moulds onto moving belt - after inverting moulds which are then removed by parallel conveyor
CARLE AND MANOTANARI SPA 06.08.76-IT-026108
*+Q35 (11.04.79) *DT2733-843 +B29c-07*

Appts. for discharging moulded prods., e.g. chocolate, comprises a device for lifting filled moulds from the feeding conveyor to a higher level for transfer to another station, and a device for up-turning moulds which have not been transferred by the lifting device, the prods. being removed by a conveyor.

The appts. allows the filled moulds to be discharged directly onto a conveyor, or to be transferred to another mould-unloading station, as circumstances require, and is thus of a simpler nature than previous appts. 11.5.77 as 019697 (6pp1379)

UNIL D13 70473X/38 =GB 1544-200
Co-trans-esterified olein fat fraction used in margarine prepn - contg 30-46 per cent palmitic radicals and 42-62 percent 18-C cis unsatd acids
UNILEVER LTD 04.03.75-GB-008938
*(D23) (11.04.79) *BE-839-108 A23d-03 +A23d-05*

A fat prod. for use in preparing shortenings and emulsified food spreads (margarines etc.) comprises a fraction of a corandomised fat blend. The fraction contains 30-46 (36-40)% palmitic acid residues and 52-62 (50-55)% unsatd. fatty acid residues with a chain length of 18C atoms contg. only cis double bonds and $\not>$5% triglycerides of satd. fatty acids with a chain length of $\geqslant$16C atoms.

Pref. the fat prod. comprises 55-95 (70-90)% of the fat blend. The food spreads obtd. have improved butter-like properties. 3.3.76 (14pp992)

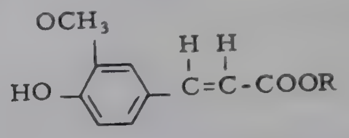
Fungicide and rancidity preventing agent contains as active agent a cpd. of formula (I) (where R is H, alkyl or aryl).



(I)

Cpd. shows the excellent fungicidal effect and is effective in the prevention of hydrolytic rancidity, ketonic rancidity, oxidative rancidity.

20.4.77 as 045577 (3pp108)

NAGA- ★ D13 28590B/15 ★ J5 4028-838
High protein food prepn. - by pasteurising koji with aq. ethanol soln. then mixing with steamed soya bean and maturing
NAGANO MISO KK 02.08.77-JA-092183
(03.03.79) A21d-02/36 A21d-13/06 A23c-15 A23c-19 A23j-03

The method comprises pasteurising 'kofi' with alcohol or aq. ethanol soln., mixing with steamed soy bean and maturing the mixt. Aq. ethanol soln. having ethanol concn. > 15% can be used and inactivation of enzymes in 'kofi' can be suppressed by using aq. ethanol soln. having ethanol concn. > 55%.

Soy bean is sterilised by steaming and proteinous food material can be prepd. without depending on the pasteurising effect of salt. Thus obtd. food material can be used for prepg. various foods having low salt concn., such as 'miso', mayonnaise, sauce, spread, soup, break, confectioneries, etc. 2.8.77 as 092183 (10pp5)

KITA/ ★ D13 28591B/15 ★ J5 4028-839
Prepn. of instant food having fried bean curd like structure - by preparing dough from edible oil and heat coagulating protein moulding dielectric heating and opt. impregnating with seasoning
KITAMURA Y 02.08.77-JA-092199
(03.03.79) A23l-01/34

The method comprises (1) prepg. dough from a mixt. contg. at least edible oil and heat-coagulating protein, so that the moisture content is in the range of colloidal semi bonded water, (2) moulding in the range showing reversib standing phenomenon, (3) dielectric-heating the moulded dough with the power density of microwave output >8 kw on 1 kg of the moulded dough to the structure like fried bean curd, (4) opt. impregnating seasoning and (5) dielectric-heating under the vacuum of 10-100 torr.

Novel instant food can be prepd. without the oil-frying process. 2.8.77 as 092199 (5pp5)

OGAW/ ★ D13 28592B/15 ★ J5 4028-8
Preserving plants and foods - by treating with aq. mannan soln.
OGAWA Y 02.08.77-JA-093079
(03.03.79) A23l-01/21 A23l-03/34

The method comprises treating fruits, vegetables, fishe shellfishes, other plants and foods by (1) steeping in aq. soln. of mannan, (2) coating them with the soln. or (3) b adding the soln. to them and mixing.

The inventor has found that the aq. soln. of refined mannan shows insect-proof activity, antiseptic activity anti-mould activity.

Refined mannan can be obtd. by pulverising the crude dry 'konjak' flour in hydrophilic solvent such as methan ethanol, propanol, etc. and sepg. mannan from the mix Mannan is a natural inexpensive polysaccharide and has been used as food. It is used in the form of aq. 0.01-0 soln. and excellent antiseptic and anti-mould effect can e attained by combining refined mannan powder at 2% in oods. 2.8.77 as 093079 (3pp5)

ISP ★ D13 28593B/15 ★J5 4028-842

oodles prepn. using aq. ammonia - added to noodles raw aterial, to modify wheat protein in flour and avoid problems ncountered with brine

NISSIN SHOKUHIN KAISHA 05.08.77-JA-094352

(03.03.79) A23l-01/16

he method comprises adding ammonia water to noodle aterial such as flour, starch, etc. and prepg. noodles s usual. Ammonia can be removed from the noodle in the nitial stage of the heat-treatment. Usually ammonia water (26-30 w/w%) is used 0.1-4.0 ml, pref. 2.0-3.0 ml on lour 1 kg. Gluten may also be combined in noodle to improve the texture, to increase the visco-elasticity of obtd. oodle, and to suppress the dissolving-out of the solid rom obtd. noodle.

Brine has been used to give proper texture and smoothess to noodles, but it often causes browning of noodles on eat-treatment. Ammonia water is used instead of brine nd wheat protein in flour can be denatured with it. Excellent noodles can be prepd. avoiding defects of prior art. 5.8.77 as 094352 (4pp5)

KIBU- ★ D13 28594B/15 ★J5 4028-847

Oil-contg. konjak prepn. - by emulsifying edible oil, adding konjak powder and kneading, adding alkaline gelling agent and coagulating

KIBUN KK 09.08.77-JA-094637

(03.03.79) A23l-01/21

The method comprises emulsifying edible oil with emulsifier or a substance having emulsifying ability, kneading the 'konjak' paste prepd. of refined 'konjak' powder and the emulsion, adding alkaline gelling agent in the mixt. and coagulating it by heating.

The 'konjak' shows the taste and flavour of edible oil as well as original taste and flavour of 'konjak' and has a proper viscosity and soft texture. When it is heat-cooked, crisp cooked food can be obtd. 3.8.77 as 094637 (3pp5)

KANF ★ D13 28595B/15 ★J5 4028-849

Fibrous complex food - prepd. by relaxing wheat protein, mixing with high molecular polysaccharide kneading and fiberising

KANEGAFUCHI CHEM KK 03.08.77-JA-093708

(03.03.79) A23j-03

The food is prepd. by (1) relaxing wheat protein with relaxing agent and common salt, (2) mixing with the high molecular polysaccharide, of which amt. is 40-400% on the solid in wheat protein, (3) kneading the mixt. and (4) fiberising the mixt. by extending and stretching the mixt. with rubbing it at the presence of alkali(ne earth) metal chloride.

The fibrous complex food is excellent in taste and flavour. By combining proper seasoning or flavour in it new snack food, dainty and meat-like food can be obtd.

As wheat gluten raw gluten or the active gluten which is previously hydrated to moisture content 60-70% can be used. As relaxing agent, caustic soda, ammonia, acidic sodium sulphide, glutathione, papain and thermoase can be used. 3.8.77 as 093708 (4pp5)

NISE- ★ D13 28596B/15 ★J5 4028-850

Mfr. of vegetable proteinaceous food for e.g. sausages - by kneading wheat gluten and oil and fat, gelling vegetable protein and regulating moisture content, and kneading the components

NIPPON SEIFUN KK 09.08.77-JA-095286

(03.03.79) A23j-03

The method comprises (i) prepg. the gluten paste by kneading wheat gluten and the oil and fat which is solid at normal temp. at a temp. above m.pt. of the oil and fat, (ii) prepg. the semi-dry fibrous food material by gelling the food material mainly of vegetable protein and regulating the moisture content of the obtd. gelled material to 30-65 w/w% and (iii) kneading the gluten paste obtd. in (i) and the semi-dry fibrous food material obtd. in (ii).

As oil and fat lard, tallow, mutton fat, cacao fat, coconut oil, palm oil, etc. can be used and they are used in an amt. of 15-45 (24-36) w/w% on dry wheat gluten. The gluten paste is composed of wheat gluten (dry wt.) 15-30 w/w %, oil and fat 2.5-12 w/w% and water 30-60 w/w%. The vegetable proteinous food can be prepd. by combining the semi-dry fibrous food material in an amt. of 20-40 w/w% in fluten paste.

The semi-dry fibrous food material obtd.in (ii) is similar to crab meat and that prepd. of wheat gluten is excellent in oil-absorbing property and preservative property. The semi-dry fibrous material is further kneaded with the gluten paste and the obtd. vegetable proteinous food can be used as the material for ham, sausage, instant foods, etc. 9.8.77 as 095286 (6pp5)

MEIJ ★ D13 28600B/15 ★J5 4028-863

Prepn. of cocoa of intensified taste and flavour - by alkali treating unroasted or weakly roasted cocoa nib, adding protein and/or peptone, drying and roasting under alkali and mashing

MEIJI KK 09.08.77-JA-094675

(03.03.79) A23g-01

The method comprises (1) alkali-treating unroasted or weakly roasted cocoa nib, (2) adding ≥1 kind of protein and/or peptone at the beginning, during or after the alkali-treatment, (3) drying and roasting the whole mixt. under alkaline conditions and (4) mashing, oil-pressing and pulverising thus obtd. roasted nib as usual.

Flavouring components are more formed, compared with those formed by simple alkali-treatment. The taste and flavour of obtd. cocoa is partic. well harmonised with milk component.

As protein component casein, sodium casein, egg white, gelatin, soy bean protein, wheat protein, skimmed powdery milk and/or whey powder can be used. 9.8.77 as 094675 (9pp5)

MIYA/ ★ D13 28601B/15 ★J5 4028-865

Salt-contg. powder prodn. - by mixing egg white and sodium glutamate-contg. sea water, whipping and powdering

MIYAI J 03.08.77-JA-093709

(03.03.79) A23b-05/02 A23l-01/22

The powder is prepd. by (1) mixing egg white (100 ml) and sea water soln. (200 ml) in which sodium glutamate (1g) is dissolved, (2) whipping the mixt. (3) spreading the mixt. on a thin plain plate such as plate glass, (4) drying it naturally in air or under sunlight or artificially and (5) grinding it down to a white fine powder.

The powder can be easily dissolved in the mouth. In cold water it floats on the surface and in hot water egg white is easily coagulated and sepd. It can not be used for cooking, but it can be used for sprinkling on food or for mixing with food. 3.8.77 as 093709 (2pp5)

KAWA/ ★ D13 28602B/15 ★J5 4028-866

KAWASHIMA Z 03.08.77-JA-093766

(03.03.79) A23l-01/22

The method comprises combining odorless garlic, water-oat powder, chlorella powder, chlorophyll, etc. in seasoning such as 'miso', 'syoyu', sauce, etc. Further proteins muco-polysaccharide, unsatd. fatty acid, nicotiniç acid, carotine, pantothenic acid, vitamin C, vitamin B gp., vitamin E, vitamin H, mineral, xanthophyll, chlorophyll, etc. in above substances improve taste and flavour as well as nitritive value synergically.

Taste and flavour and nutritive value of seasonings can be improved remarkably. 3.8.77 as 093766 (2pp5)

HIJI/ ★ D13 28603B/15 ★J5 4028-867

Non-intestinally absorbed sweeteners - comprising sweet substance to which ligand is attached and non-absorbable material is attached to ligand

HIJI Y 01.08.77-JA-092358

B04 (03.03.79) A23l-01/22

Non-intestine-absorptive sweet substance can be prepd. by (1) adding "spacer arm" to sweet substance to form ligand complex and (2) adding non-intestinally-absorptive substance showing good affinity to living body to the spacer arm of the ligand.

Natural or artificial sweetener can be made non-intest-

ine-absorptive and nontoxic dietic sweetener can be obtd.
As sweet substance glucose, fructose, sucrose, saccharin, dulcin, cyclamate, etc. can be used and as non-intestine-absorptive substance showing good affinity to living body cellulose or its oligomers can be used. As the ligand, o-glucoside, N-acylglucosylamine, N-acylamino sugar, thioglycoside, etc. can be used. 1.8.77 as 092358 (8pp5)

NITO/ ★ D13 28604B/15 ★ J5 4028-868

Low calorie sweetener compsn. - is obtained from liquid extract of Stevia plant and maltose soln.

NITO Y 05.08.77-JA-093404
B03 E13 (03.03.79) A23l-01/22 A61k-31/70

The method comprises (1) adding the decomposing enzyme in the dispersion of starch or polysaccharide; (2) adding the liq. extract of Stevia plant in thedispersion; (3) decolourising, filtering, intermediate concentration, ion exchanging and concentrating the mixt.; and (4) centrifuging, washing and drying the formed crystalline substance.

Stevioside has sweetness 200 times as strong as that of sucrose but it also has bitterness and it is deliquescent. Maltose is a sweet and soluble white crystalline substance and it does not increase the blood pressure value. Hence maltose has been used widely as a medicinal sweetener for patients suffering from diabetes, etc. However, its sweetness is only 1/3 that of sucrose. By the invented method, Stevia extract and maltose are combined to make use of their advantages.

Usually Stevia extract and maltose soln. are used in proportionof 1-30-150 to obtain sweetness similar to sucrose. Pref. the content of Stevia extract in objective sweetener is maintain < 45°C. 5.8.77 as 093404 (2pp5)

HORI- ★ D13 28605B/15 ★ J5 4028-869

Bitter extract removal from Periandra plant - by contacting underground part of plant with hydrophilic organic solvent at specified PH at which sweet extract is not removed

HORIUCHI ITARO SHOT 08.08.77-JA-094159
B04 (03.03.79) A23l-01/22

The underground part of the plant of Periandra or its processed substance is contacted with hydrophilic organic solvent or hydrous hydrophilic organic solvent at pH > 3 for extracting and removing bitter substance. Periandra plants contain bitter as well as sweet substances in their underground parts. At pH > 3, pref. > 5, the bitter substance has high solubility and the sweet substance has low solubility in hydrophilic organic solvent or hydrous hydrophilic organic solvent.

Periandra mediteranea and P. dulcis can be used. As the processed substance of Periandra plants, the concd. extract, its partly refined concentrate or the ppte. contg. the sweet substance which can be obtd. by extracting Periandra plants with water at pH < 3 and adjusting pH of the extract to > 5 can be used. As the hydrophilic organic solvent, ethanol can be used, and as hydrous hydrophilic organic solvent, hydrous ethanol having water content < 15%, pref. < 5%, can be used. 8.8.77 as 094159 (4pp5)

HORI- ★ D13 28606B/15 ★ J5 4028-870

Decolourised, refined sweet extract prepn. - by treating extract from under-soil section of Periandra plant with hydrogen peroxide

HORIUCHI ITARO SHOT 08.08.77-JA-094160
B04 (03.03.79) A23l-01/22

The method is effected by decolourising and refining the sweet substance. contg. extract which is prepd. from the underground part of the plant belonging to Periandra, with hydrogen peroxide.

Periandra mediteranea and P. dulcis can be used. Though the sweet substance has not been identified, it is quite different from glycyrrhizic acid, stevioside, etc. and can give refreshing sweetness. Suitably, aq. 35% hydrogen peroxide soln. is added 1-10 ml on 1 litre of the extract and the treatment is carried out at 0-80°C for 1/6-24 hrs. 8.8.77 as 094160 (4pp5)

AKIY- ★ D13 28607B/15 ★ J5 4028-871

Conc. onion extract-cyclodextrin inclusion cpd. - used e.g. to treat high blood pressure, arteriosclerosis, thrombosis and diabetes

AKIYAMA JOZAI KK 04.08.77-JA-093651
A96 B04 (03.03.79) A23l-01/34

The inclusion cpd. is pr
juice of onion bulbs at 60-90°C and including the concd. extract in cyclodextrin. Any of α-, β- and α-cyclodextrin can be used and the onion extract can be included in the voids of 6-10 Å in cyclodextrin. The inclusion can be practiced by mixing cyclodextrin with 10-100 w/w% of water t make it pasty, kneading it with the extract, of which amt. is 0.5-2 (0.8-1.2) times in wt. on cyclodextrin, for 4-10 (6-8) hrs. and drying the mixt. under reduced pressure.

The onion extract is effective on high blood pressure, arteriosclerosis, thrombosis, diabetes, etc. and gives nutritive effect and healthy effect. By including the concd. onion extract in cyclodextrin the effects can be stably held for > 6 months and the specific odour of onion can be mi igated. 4.8.77 as 093651 (3pp5)

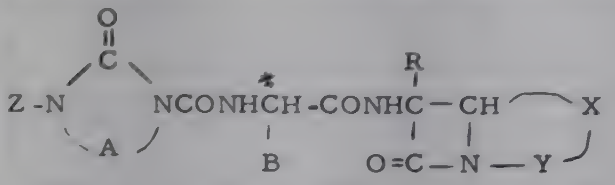
*B02 C02 (03.04.79) *BE-836-022 A61k-31/54 C07d-499/46 C07d-501/34*

-Lactams (I) and their salts are new. In the formula R is H or OCH_3; A is ethylene, trimethylene or benzo; B is phenyl opt. substd. by halo, OH, lower alkyl, CN or methylsulphonyl or is cyclohexenyl or cyclohexadienyl;



(I)

X is S, O, SO, SO_2 or CH_2; Y is $-C(COOH)H-C(CH_3)_2-$ or $-C(COOH)=C(CH_2T)-CH_2-$ where T is H, lower alkanoyloxy, OH, pyridinium, carbamoyloxy, azido, -CN, -SPh or -SHet where Het is a 5-6 member heterocycle which is opt. substd.; and Z is R^1-CH=N- where R^1 is 3-10C cycloalk(en)yl, pyridyl, styryl, (un)substd. phenyl, (un)substd. thienyl, (un)substd. furyl or opt. methyl substd. isoxazolyl.

The cpds. are antibiotics having broad spectrum activity against Gram positive and Gram negative bacteria coupled with low toxicity. They are used as preservatives for paper, timber, leather, paints etc.; as animal feed additives; and medicinally against local and systemic infections. Dose is pref. 20-30 mg/kg. 13.11.75 as 631515 (+25.3.75 - DT - 512998) (51pp945).

OLIN ★ D13 29664B/15 ★US 4147-757

Prodn. of ammonium phosphate of low arsenic content - from crude phosphoric acid, using reducing agent to prevent co-pptn. of arsenic

OLIN CORP 18.11.77-US-852649 (13.12.76-US-749856)

C04 E35 (03.04.79) C01b-15/16 C01b-25/26

Arsenic-free ammonium phosphate is made by (a) reacting crude H_3PO_4 contg. dissolved As in the +5 valence state with NH_3 and an As-reducing agent to form ammonium phosphate soln. and to reduce the As to a lower valency state; (b) crystallising the ammonium phosphate from the soln. to leave a mother liquor contg. virtually all the As; and (c) recovering the crystalline prod..

The process employs relatively cheap, crude As-contg. H_3PO_4 made by the wet process, and gives a relatively pure prod. suitable for foodstuff and industrial use and as a fertiliser. Redn. of the As in the soln. prevents co-pptn. of the As with the ammonium phosphate and thus gives a purer prod.. 18.11.77 as 852649 (8pp513).

Improving the digestibility of feed vegetable protein - by heating with edible acid to increase hexose content

CARGILL INC 29.10.74-US-518766 (21.08.72-US-282541)
C03 (03.04.79) A23j-03/10

Nutritional value of a particulate vegetable protein is improved by heating with an edible acid at pH 1.0 to 5.0 and at 250 - 450°F for such a time that the hexose level is increased to >3.5% and the PER is >2.0.

The vegetable protein may be derived from soya beans or cotton seed. Edible acids include HCl, phosphoric acid, sulphuric acid, acetic acid, lactic acid, and citric acid. The product may be extruded and then cut into 'pellets'.

The product is used as a feed or food supplement with the enzymes and antigrowth factors removed. The palatibility, nutritional value and digestibility are improved. 29.10.74 as 518766 (6pp916).

Ice-cream portioning spoon - with spring loaded hinged lever strip to lift out scraped portion

SCHRODER K W 27.09.77-DT-743308
(05.04.79) A23g-09/28

A spoon to ladle out portions of ice-cream from a container and transfer them to a cornet is fitted with a spring-loaded lifting plate which normally lies flush in a recess at the spoon bottom. The other end protrudes over the spoon handle. When a portion is to be transferred to a cornet, the free end is depressed against the force of a spiral spring, and the other end, which is 1to 2 cm wide, lifts out the ice cream portion.

This is an uncomplicated tool to detach the ice cream portion from the hemispherical spoon. 27.9.77 as 743308 (8pp39)

AMFA- ★ D14 28078B/15 ★DT 2810-040

Potato chip cutter - has blades set at distances increasing towards the perimeter area of the potato

AMFAC FOODS INC 23.09.77-US-836050
P62 (05.04.79) B26d-03/20

The cutter is fitted with blade sets with mutual distances selected in such a way that it produces chips with different cross-sections. The chips cut from the central part of the potatoe are thinner than the ones cut from the peripheral part. By this arrangement the circumstances is compensated that the texture of the central part of the potatoe is denser than the peripheral part. This produces in the frying process a more uniform chip bulk.

The cutter assembly consists of side blades which remove from the basically ball-shaped potatoe the four-calotte-shaped slices. Inside these four blades a system of blades arranged perpendicularly at each other is provi -ed. The blade sets are mounted in a retreating pattern with the sets nearest to the walls uppermost and sets in the central part at the bottom. 8. 3. 78 as 810040 (19pp55

Press filter of moving belt type - has pressing belt of foam material having an impervious surface facing press zone
SULZER BROS LTD 02.02.78-CH-001131 (29.09.77-CH-011900)
A88 J01 P71 (11.04.79) B01d-33/04 B30b-09/24

Moving belt press filter has a pressing zone defined between a pressing belt and a screening belt with a feed arrangement for distributing material to be pressed over an inner region of the belt.

The pressing belt comprises a foam material impervious to liq. on the surface which faces the pressing zone. The foam material bears by its edge portions, in the pressing zone, on the edge portions of the belt.

Fine particles do not impair the filtration capacity and the material undergoing pressing is prevented from lateral escape. 27.9.78 as 038327 (3pp1050)

TERL- ★ D14 28992B/15 ★NL 7809-531
scraping heat exchanger of blade and drive design - gives effective scraping at low speeds with minimal damage to prods in the treated medium
MACH FAB TERLET 23.09.77-NL-010447
J08 Q78 (27.03.79) F28d-11

Heat exchanger comprises an annular cylindrical space in which the medium is treated, a vertical drive shaft to which is mounted the scraper device, and hollow walls through which a heating or cooling heat transfer medium is passed. The scraper device consists of a horizontal arm at the top of the cylinder and connected to the drive shaft and vertical scraper shafts positioned in the centre of the annular space and attached to the outer ends of the drive arm.

The scraper blades consist of sheet metal plates with the outer edge in contact with either the inner or outer a wall of the annular space and with the central part wrapped around the shaft to provide a mounting. In motion, the blade is oushed against the wall by the hydraulic pressure or the medium and presents a clean flow surface to the material scraped from the wall.

The device operates effectively at a low rotational speed so that mediums such as jams can be treated without damaging the fruit. The clean flow surfaces prevent the material from being trapped by the agitator blades. 19. 9. 78 as 009531 (13pp1370)

Granular filter material e.g. for water treatment - prepd. by classifying coal-contg. raw material before pelletising with thermosetting resin and solvent

RUHRKOHLE AG 22.09.77-DT-742680

A81 J01 (05.04.79) B01d-39/02

Granular filter material for processing drinking water and water for industrial use is prepd. from a high C-contg. raw material, e.g. anthracite coal, by grinding the starting material, mixing with a binder and simultaneously pelletising, and then heating to expel volatile components. Novelty consists in narrowly grading the starting material after or during comminution and pelletising only selected grain sizes with the addn. of a thermosetting resin and also of a solvent.

The filters may also be used for processing and purifying other liqs. and gases. Pore vol. can be adjusted to requirements. Energy can be saved by using thermosetting resins hardening at 150°C. Strength and abrasion-resistance can reach those obtd. on using coked pitch or tar pellets. 22.9.77 as 742680 (10pp200)

ALDA/ ★ D15 27976B/15 ★DT 2742-801

Water treatment plant - assembled from containerised units to international standards

ALDAG W 23.09.77-DT-742801 (00.00.76-DT-635670)

(05.04.79) C02b-01 C02c-01/06

Treatment plant for water and other fluids is assembled from tanks which meet the internationally standardised requirements for containers as regards dimensions, weight and strength. They are made of steel sheets, steel sections and/or Al sheets, Al sections and/or reinforced plastics.

Containerised water treatment plants combine the advantages of stationary with those of portable installations. The units can be easily stored and quickly transported on site, specially in countries with an inadequate infrastructure, for military purposes and in emergencies. 23.9.77 as 742801 (18pp39)

BAUE/ ★ D15 27979B/15 ★DT 2742-832

Raw sludge prepn. and mixture with coal dust - in solar cell with felt band conveyors, giving product useful as fertiliser

BAUER O 23.09.77-DT-742832 (00.00.72-DT-260616)

(05.04.79) C02c-03

The Parent Patent described a sewage treatment to produce raw sludge. This is mixed with coal dust and passed into a double-glazed structure with several endless felt band conveyors arranged above each other. The top conveyor is used for predrying by solar radiation. The lower conveyors are exposed to infrared and ultraviolet radiators. Air inlets and outlets provide for ventialation and vapour extraction. The bottom conveyor discharges the prepared sludge.

The coal dust can be produced by carbonising a part of the sludge so that no additives or chemicals need be bought. The end product is suitable for use as fertiliser. The new system needs a minimum of extraneous energy. 23.9.77 as 742832 Add. to 2260616 (26pp39)

VEKE- ★ D15 28032B/15 ★DT 2744-050

Packing for trickling water tower - with corrugation inlets and outlet alternating on every other panel of plastics foils

VER KESSELWERKE 30.09.77-DT-744050

(05.04.79) C02b-01/10 C02c-01/04

The Parent Patent described a packing for trickling towers to be used in the aeration of drinking water and in the biological digestion of organic contents which consisted of corrugated plastic foils, subdivided into panels. The directions of inlet and outlet of each panel are now reversed in every other panel.

This results in a more uniform distribution of the trickling water over the panel width. The original panel tended to drive the water towards one of the longitudinal edges. 30.9.77 as 744050 Add to 1759102 (7pp39)

METG ★ D15 28060B/15 ★DT 2744-437

Processing waste waters from coal degasification or gasification - by solvent extn., stripping and separating ammonia and acid gases

METALLGESELLSCHAFT AG 03.10.77-DT-744437

E35 H09 (E14) (05.04.79) C01c-01/10 C02c-05 C07c-39/04

Waste waters obtd. in degassing or gasifying coals are processed by extracting the organic impurities with an organic solvent which is insoluble or only slightly soluble in water, and working up the extract to crude phenol and fresh solvent; removing solvent residues in the extd. waste waters by stripping with gases; washing the gases to recover the organic solvent; removing NH_3 from the extd. waste water by stripping with steam in a distn. column; condensn. of distn. column head prod. and recycling part of condensate to column head.

Novelty consists in not condensing a part. of distn. column head prod. and transferring the vapours to a wash column, where water, small NH_3 quantities and total acidic gases are condensed in stages in top part of wash column, and pure NH_3 is drawn off overhead. The condensate contg. all acidic gases is drawn off from the upper part of the wash column, transferred to a separate reboiler and heated. A small quantity of cold water is added to wash column head. The wash column sump prod. is drawn off and transferred to a pressure deacidification column, where the acid gases H_2S and CO_2 are drawn off overhead, under pressure. The pressure deacidification column sump prod., consisting of an NH_3-rich soln., is recycled to the distn. column. 3.10.77 as 744437 (14pp200)

GENE ★ D15 28180B/15 ★DT 2842-729

Regenerating spent anionic and cationic exchange resin mixt. - using a device contg. vertically assembled resin separator, ultrasonic purifier and bottom mixer

GENERAL ELECTRIC CO 03.10.77-US-838815

A91 J01 K06 (05.04.79) B01j-01/09

Installation for regenerating a mixt. of spent anionic and cationic exchanger resins contains a resin separator, an ultrasonic resin purifier and a resin mixer, arranged vertically to one another. The resin separator is in the highest position, the purifier is directly below the separator and the mixer is directly below the purifier.

A device is provided for conveying the spent resins to the separator; a device for allowing the resins to fall, by gravity, through ultrasonic purifier down to resin mixer; a device for actuating the ultrasonic purifier while the resins fall through it, so as to remove the impurities from resin; a device for charging a liq. carrier, e.g. water, countercurrently to resin, to carry impurities removed from resin to the separator, and also a device for removing the impurities from the resin separator.

Plant serves partic. for purifying and chemically regenerating resins used in a condensate treatment system, esp. for a nuclear energy plant. Waste water quantity is reduced, e.g. from 38000 l. to 3800 l. Space is saved. Resins can be regenerated in which ratio cationic : anionic resin varies greatly. The separator can be used as anionic resin regenerator tank and the mixer as cationic resin regenerator tank. 30.9.78 as 842729 (24pp200)

SABL- ★ D15 28204B/15 ★FR 2396-727
Biological purificn. of waste water, esp. domestic - using oxidn. stage then decantation and nitrification stage
SABLA 05.07.77-FR-021386
(09.03.79) C02c-05/10

The process comprises, opt. after a primary decantation, a first oxidn. phase in an aerated medium of a substantial part of the organic materials followed by an intermediate decantation and then a second nitrification phase of a substantial part of the nitrogeneous materials. The process is characterised by the fact that (i) the nitrification is carried out on at least one bacterial support, (ii) as a function of the max. BOD5 concn. B at the end of nitrification, the max. concn. A at the start of this stage is determined such that B is 0.35A+9 is satisfied, that for a value of A below 100mg/l and a BOD5 charge at the nitrification stage of at most 6g/m^2/day; (iii) the dimension of the bacterial support is determined from the BOD5 charge x and the nitrification charge y to satisfy the approx. relation y_{10}=-0.25+0.5, x being from 1-4g/m^2/day and the ambient temp. 10°C; the correction for a temp. Θ being $y_\Theta=0.212.1.0725^{\Theta-10}.y_{10}$

The process enables a greater efficiency at both stages and lower plant costs. 5.7.77 as 021386 (11pp597)

Water distn. appts. - partic. for purificn. of sea water
NAYLOR L B 18.07.78-GB-030187 (18.04.77-GB-015945)
J01 (11.04.79) B01d-03

A distn. appts. has a first feeder vessel, a second clo vessel the top of which is connected to a heat exchanger the feeder vessel by a conduit, and which has a greate height than a barometric column of water. The conduit open to the vessel and has a closable vent to the atmos and a portion of the conduit between the vent and vesse being connected to an inlet.

A low differential pressure pump is connected to the base of the vessel by a conduit with a valve to close off the conduit. A third, closed vessel has its lower region connected to the vessel by a conduit which is closable by a valve and the tops of vessels are interconnected by a conduit. The pump is operable to evacuate vessel and the conduits. A heat exchanger heats the water in the closed vessel.

Used for purification of naturally occurring masses of water, e.g. sea water. 18.7.78 as 030187 (6pp50)

HOUD ★ D15 28277B/15 ★GB 2004-858

Activated sludge appts. - for treating waste in an oxidn. ditch

HOUDAILLE INDS INC 03.10.77-US-839011

(11.04.79) C02c-01/06

Raw waste is aerated and injected into an oxidn. ditch, defining a continuous closed flow path, under pressure so the waste moves round. Treated waste from the oxidn. ditch is passed to a clarifier where it is sepd. into clarified effluent and sludge, the sludge being aerated and reinjected into the ditch.

Used in the treatment of waste water. The system has reduced energy requirement, and can be adapted to efficiently compensate for diurnal or other variations in sewage flow which are common in medium size treatment plants. 28.9.78 as 038544 (16pp50)

STIG/ ★ D15 28278B/15 ★GB 2004-859

Mobile sludge treatment appts. - using chemical treatment and dewatering to separate sludge and water

STIGEBRANDT A 30.09.77-SW-010986

(11.04.79) C02c-01/18

The sludge water content of a waste water well is transferred into a collecting tank in the mobile appts., where it is treated with ≥1 chemicals. The sludge water or sediment therefrom is sepd. and dewatered, the dewatered sludge and purified water are collected respectively in a sludge container and a purified water tank, during transport of the appts. to the next waste water well to be treated.

The sludge water content of the next waste water well is transferred into the collecting tank while adding more chemicals, and the purified water collected during the tran transport and emanating from the previous well is transferred into the next well, while simultaneously subjecting the new sludge in the collecting tank to floccing and, if necessary, sedimentation.

Used for treatment of waste water from ≥1 residual houses. Previously the whole well content was transferred to a central purification plant, requiring long transports and high capacity in the central plant. Using the mobile plant reduces the transport and central plant requirements. 2.10.78 (7pp50)

ERAP ★ D15 28289B/15 ★GB 2004-997

Sludge incineration process - by inejction of pulverised sludge into a combustion zone

ELF AQUITANE 29.09.77-FR-029264

Q73 (11.04.79) F23g-05/12

A combustible gas with a large amt. of excess air, as an extremely homogeneous mixt. is delivered to plural locations over the lower part of a combustion zone, in which the combustible gas is burnt, while injecting a jet of finely pulverised sludge into the zone. The jet of sludge is produced by injecting sludge into a limited space, while imparting a rotational motion about an axis, and causing the sludge to leave the space as an outlet jet, into which a number of air jets are directed in a tangential direction to finely pulverise the sludge outlet jet.

Used for incineration of industrial or city waste material in the form of partially combustible sludge. The appts. produces a finely distributed dispersion of the sludge in a limited combustion space. The method of pulverisation reduces risk of clogging which occurred in prior appts. 28.9.78 (12pp50)

Treating ammonium ion-contg. sewage - by adding coagulant, treating with chlorine and then passing through activated charcoal

NIPPON JUTAKU KODAN (JAOR) 04.08.77-JA-092998

(03.03.79) C02c-01/40

An ammonium ion-contg. sewage is purified with reduced amt. of chlorine and without formation of H_2S by (1) adding a coagulant, e.g. a combination of polymer coagulant and inorganic coagulant e.g. $AlCl_3$ and alum etc. to remove by flocculation precipitation a portion of organic matters and suspended solids; (2) adding Cl_2 in an amt. of 6-7 ppm per ppm of ammonium ion to convert the greater portion of ammonium ion into a chlorine-binding cpd., e.g. monochloramine and dichloramine etc. also to convert by oxidn. a portion of the ammonium ion into NO_3^- (about 10 ppm); and (3) subsequently passingit through activated charcoal layer(s) to remove organic matters by adsorption and simultaneously to decompose the chlorine-binding cpd. into N_2. The NO_3^- further serves to suppress the generation of H_2SO_4-reducing bacteria in the activated charcoal layers, so that generation of H_2S is prevented. 4.8.77 as 092998 (6pp34)

Deodorising phosphine-contg. effluent - by treating with oxidising agent

IHARA CHEM KK 04.08.77-JA-093565

E11 (D22) (03.03.79) C02c-05/04

Treatment of phosphine-evolving effluent, resulting from prodn. of phosphines, e.g. trialkyl phosphine and triarylphosphine, etc. suitable for use as catalyst or reducing agent in organic synthesis is described. Effluent is completely deodorised by treating it with an oxidising agent, e.g. H_2O_2, NaClO, Cl_2, O_3 $KMnO_4$, peracetic acid, perbenzoic acid etc. in a closed vessel at pH $>$ 4, pref. $>$ 9 and 10-30°C under agitation.

In an example, 100 ml of phosphine-smelling effluent (pH = 11.7; phosphine concn. 10 ppm) was charged into a 200 ml conical flask and adjusted to pH of 11.7, after which 0.15% H_2O_2 soln. was added so as to give 30 ppm concn. followed by allowing to stand. After 4 hrs., phosphine-smell is completely removed. 4.8.77 as 093565 (3pp34)

Denitrifying biologically polluted water - using a nitrification vessel settling pond and denitrification vessel

EBARA INFILCO KK 04.08.77-JA-093576

(03.03.79) C02c-01/02

Polluted water oozed-out from waste landfill sites contg. a large amt.of BOD components and nitrogen cpds. is subjected to a biological denitrification treatment by introducing it into a nitrification vessel together with a sludge recycled from a settling pond to decompose by oxidation the BOD components and to nitrify NH_3 by nitrifying bacteria; introducing the nitrified mixed liquor into the settling pond to carry-out solid-liq. sepn.; recycling the greater portion of the supernatant liquor to the wastes landfill sites where NOx is decomposed by reduction into N_2 by the action of bacteria and the BOD components.

Further organic matters existing in the landfill sites are decomposed into CO_2 and H_2O by the action of NOx-Ox contained in the circulating liquor, thereby methane generation is decreased, the recycling liquor re-dissolving the BOD components and ammonia on passing through the landfill sites and flowing into the nitrifying vessel together with the sludge.

A remaining portion of thesupernatant liquor is flowed-out into rivers or introduced into the denitrification vessel where NOx is reduced to N_2 and flowed-out into rivers. 4.8.77 as 093576 (4pp34)

Waste water treatment by reverse osmosis - the water in the concn. chamber being externally circulated through a sodium ion-type cation exchanger

EBARA INFILCO KK 03.06.74-JA-062643

A91 J01 (A11) (20.03.79) B01d-13 B01j C02b-01/82 C02c

In waste water treatment by reverse osmosis, the water in the concn. compartment is externally circulated through a Na^+-type cation exchanger to remove the contaminating ions and prevent scale deposition on the reverse osmosis membrane.

In an example, industrial waste water (total hardness 25-35, Fe 0.1, SiO_2 50-60 ppm) was recycled after reverse osmosis using 0.86m^2 cellulose acetate tubular membrane under 21.1kg/cm^2 pressure in 80% yield. The initial flux rate 470 ml/min dropped to 282 ml/min. after deposition of scale contg. Fe 20.7, Al 25.2, SiO_2 14.5, Ca 9.8, and Mg 1.8%. When the water in the concn. compartment was circulated through a 120 l. "Diaion SKIB" (RTM) tower, the flux rate drop was from 430-425 ml/min. in 700 hr. and no scale deposit was observed. 3.6.74 as 062643 B01d-13/00; C02b-1/82 (20.3 79)

Filter for removal of impurities from water and oils - has flexible filter material inside a chamber with flexible rubber walls plus electromagnet

LEGD ENG-COWS INST 03.10.75-SU-177668

A88 J01 (18.05.78) B01b-25/26

Device is used for purifying liquids, e.g. as a filter for removal of finely-dispersed organic and mineral impurities from water, and for cleaning liquid fuels and industrial and edible oils. Using additives capable of destroying urea and other similar impurities, the filter can be used in treatment of recycle water in self-contained life-support systems in submarines and space stations. It consists of a body with built-in chamber, flexible filter material, pref. 'Porolon', disposed in the chamber, with reception and clean-liquid chambers placed at opposite ends of the body, plus pipelines.

Filtration quality is increased and filter material regeneration is improved by making the chamber walls of an elastic material, e.g. a fluoroplast rubber, installed so that it can move backwards and forwards. Iron is removed and the water is disinfected by installing an electromagnet with electrodes in the receiving chamber.

Sea-water desalinator - has settling chamber with discharge opening to which heat pipe heat exchanger is connected

AS UKR HEAT PHYS 29.11.76-SU-425748

Q24 (10.05.78) B63j-01 C02b-01/12

Sea water desalinator claimed in Parent Certificate No. 355068, consisted of a submerged heat-transmitting pipeline crystalliser, in which a crystal-hydrate suspension is formed, a separator to divide the crystal-hydrates and wash them free from brine, a crystal-melter, fresh-water heating exchanger, heat-exchanger to cool the hydrate-forming agent prior to feeding it to the crystalliser, compressor and degasifier to extract the agent from the fresh water, etc. Now power consumption is reduced by providing the melter in the crystal-hydrate device with a settling chamber, in the bottom of which is a discharge opening. The heat-exchanger is made as a heat-pipe connected at the bottom end to the discharge opening.
Smirnov, L.F., Klimenko, V.V. Bul. 20/30.5.78.

Magnetic water conditioner for reducing scale formation - with array of disc magnets in cylindrical plastic housing
BROWN M J 19.07.77-US-817022
(27.03.79) B01c-35/06

Calcareous waters are magnetically treated using an appts. which includes a hollow casing in which there is a longitudinal array of magnets coaxially arranged but spaced from the inner wall of the housing. This provides an annular water treatment zone which is divided into parallel flow channels.

Water to be treated is admitted at one end of the casing and flows backwards and forwards along the channels to exit through an outlet at the opposite end of the casing. Each magnet has diametrically oppositely facing pole faces of opposite polarities and a polar axis which is normal to the longitudinal axis. The casing is made of a material having a high permeability, and the channels of materials having a low permeability. Thus the casing provides a return path for flux generation by the array of magnets.

Appts. is used for the magnetic treatment of water to reduce scale formation. Arrangement allows optimum flux field arrangement for determining the max. capacity of the unit for any one type of calcareous water. 19.7.77 as 817022 (10pp295).

JAPN D15 23696A/13 =US 4146-481
Filter of stacked plate type - with filtering spaces between plates, has rotating sliding scrapers, keeping filter spaces clear of deposits
JAPAN NATIONAL RAILWAY (TESI-) 17.06.76-JA-U79173

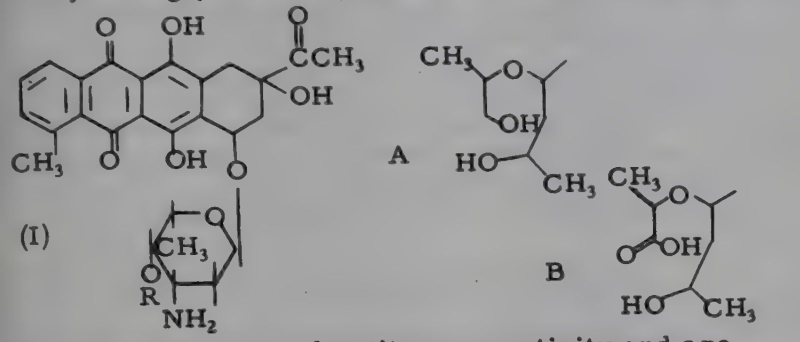
Anthracycline glycosides (I) are new (where R is a gp. (A)



(I) have antibiotic and antitumour activity and are prepd. by submerged aerobic culture of a Baumycin producing Streptomyces organism esp. Streptomyces coeruleorubiclus in aq. medium contg. C and N sources and inorganic salts. 25.5.77 as 022138 (33pp945)

SUMI/ ★ D16 28571B/15 ★J5 4028-804

Streptokinase compsns. for oral administration - contain a trypsin inhibitor, obtained from e.g. soybeans, human urine etc., and/or mucin

SUMI Y 08.08.77-JA-094822

B04 (03.03.79) A61k-37/54

Streptokinase prepns. formulated for oral administration are characterised by contg. a trypsin inhibitor (e.g. trypsin inhibitor obtd. from soybeans, human urine, etc.) and/or mucin.

The use of a trypsin inhibitor and/or mucin assists the streptokinase to be absorbed from the intestinal tracts in a stable state without being deactivated by various proteinase in the stomach or intestinals and thereby enhances the activity of streptokinase.

In an example, 100,000 units of streptokinase, L-algine-Sepharose and 10,000 units of a trypsin inhibitor obtd. from human urine (specific activity: 380 units/mg protein) were dissolved in distilled water, lyophilised and formulated into enteric coating capsules. The capsules were orally administered to group (A) of healthy male dogs. The same prepns. were prepd. except for adding 2,000 mg of mucin and orally administered to another group (B) of dogs.

Shortening of the euglobulin dissolving time is observed in about 60 min. after the administration, indicating that the activity of streptokinase is increased. Further such activity is stronger and lasts longer in Group (B) than in Group (A). 8.8.77 as 094822 (2pp140)

TORA ★ D16 28608B/15 ★J5 4028-890

Incubating living cells - by adhering them to a cationic, semipermeable membrane, and passing incubation liquor on the opposite side

TORAY INDS INC 03.08.77-JA-092589

A88 (03.03.79) B01d-13 C12b-01/20 C12k-09

The process comprises adhering living cells on to the surface of cationic semi-permeable membrane, of moisture content 20-90% and flowing an incubation liquor onto the opposite side of the membrane.

Living cells may be incubated in an increased concn. Absorption of nutrient source and exretion of the sub-layer of living cells are performed through the semi-permeable membrane without interruption by the upper-layer of living cells. 3.8.77 as 092589 (5pp68)

SANRAKU OCEAN 09.08.77-JA-094690

(03.03.79) C07g-07/02 C12d-09/20 C12d-13/10

16M-Macrolide-3-hydrolase is used to hydrolyse the ester bond of 3-position on 16 member ring macrolide antibiotics including acyl gp. through O atom at 3-position to deacylate the acyl gp. Leucomycin and spiramycin are partic. effected. Optimum pH is 7.8-8.0. Optimum temp. is 37°C.

The enzyme activity is strongly inhibited by Cu^{++}, Zn^{++}, and Hg^{++} ions, deoxycolic acid and sodium dodecyl sulphate, and somewhat inhibited by Co^{++} ion and p-chloromercury benzoate, but not inhibited by Fe^{++}, Mg^{++}, Mn^{++}, Ca^{++}, 2-mercapto ethanol, dithiothreitol and EDTA 9.8.77 as 094690 (8pp68)

TOYM ★ D16 28610B/15 ★J5 4028-893

Sarcosine oxidase prepn. - by incubating microorganism of genus Arthrobacter in nutritional medium and isolating prod.

TOYOBO KK 05.08.77-JA-094432

(03.03.79) C07g-07/02 C12d-13/10

Method comprises by incubating microorganism belonging to genus of Arthrobacter and producible sarcosine oxidase in nutritional culture medium and isolating the sarcosine oxidase from the cultured broth.

Sarcosine oxidase is an enzyme, converting sarcosine to glycine, formaldehyde and hydrogen peroxide, and it is related to metabolism of creatinine and choline. When the sarcosine is reacted with creatinine together with creatinine amide hydrase and creatine amidino hydrase, formaldehyde and hydrogen peroxide are formed. By determn. of the formaldehyde and H_2O, creatinine and creatin content may be determined. For this fact, creatinine oxidase is useful for clinical examination.

Pref. arthrobacyer ureafaciens (IFO No. 12,140) is used, inoculated in culture medium including 1% wt. of choline, 0.2 wt.% of peptone, 0.1 wt.% og yeast extract, 0.1 wt.% of $MgSO_4 7H_2O$and 0.1 wt.% of K_2HPO_4, and incubated at 30°C for 40 hrs. with shaking. 5.8.77 as 094432 (4pp68)

TANA ★ D16 28611B/15 ★J5 4028-894

Di:hydroxy-acetone prepd. from glycerol - by treating with Acetobacter or Gluconobacter bacteria prod.

TANABE PHARMACEUTICAL KK 09.08.77-JA-095660

E17 (D21) (03.03.79) C12d-13

The method is characterised by culturing bacteria which belong to Acetobacter or Gluconobacter and can convert glycerol to dihydroxyacetone in a culture medium contg. sorbitol, mannitol, glucose or dextrin as the carbon source, reacting the bacterial body sepd. from the culture medium or its processed product aerobically with the aq. soln. which has salt concn. < 0.1% and essentially contains glycerol alone, and recovering formed dihydroxyacetone.

By culturing the bacteria in the culture medium contg. sorbitol, mannitol, glucose or dextrin as the carbon source the converting ability of the bacterial body can be increased. The culture is practiced at 25-30°C at pH 5-8 aerobically for 1-3 days and calcium carbonate is added to adjust the pH. 9.8.77 as 095660 (5pp5)

Centrifugal sepn. of plasmid from Thermus bacteria - used for in vitro gene substitution

MITSUBISHI CHEM IND KK 08.08.77-JA-094767

(03.03.79) C12d-13/06 C12k-01/02

The method is characterised by sepg. and refining plasmid from bacteria belonging to Thermus by density gradient centrifuging method. Novel plasmic can be prepd. from highly thermophilic bacteria which can multiply only at > 45°C without spore-forming or parasitism and the plasmid can be used for in vitro gene-substitution at higher temp. with less danger of contamination c.f. prior art plasmid.

Thermus thermophilus HB-8 (ATCC 27634), T. flavus BS 1, T. flavus AT 61 and T. flavus AT 62 can be used. The density gradient centrifuging method is practiced utilising the density gradient in cesium chloride-ethidium bromide system and the density of cesium chloride is regulated previously to 1.59-1.60 g/ml. The plasmic which is closed circular DNA, is less bonded with the pigment (ethidium bromide) and can give heavier band in cesium chloride-ethidium bromide density gradient than open circular DNA. Plasmid having mol. wt. $6.1\text{-}6.6 \times 10^6$ or 17.0×10^6 can be obtd. 8.8.77 as 094767 (4pp5)

Highly viscous polysaccharide prepn. in high yield - by culturing pestalotia mould in medium contg. tomato juice or soybean whey
SNOW BRAND MILK PRODUCTS 09.08.77-JA-095376
(03.03.79) C12d-13/04

In the prepn. of highly viscous polysaccharide by liq. culturing a Pestalotia mould, the mould is cultured either in the culture medium contg. tomato juice or in the culture medium composed of soy bean whey and collecting formed polysaccharide from the culture medium. Highly viscous polysaccharide is prepd. in high yield.

The polysaccharide is a β-1, 3-homoglucan of average molecular wt. 300-500 and high viscous. The viscosity of its 0.1-0.4% soln. is 7-17 times as viscous as the locust bean gum soln. and its viscosity is hardly changed by pH-change and heating. Applicable strain is Pestalotia sp. No. 101 (FERM-P 4136) and the culture is carried out aerobically at ca. 30°C at pH ca. 5.0. 9.8.77 as 095376 (6pp5)

Soil conditioner prepn. from graminaceous weed Zizania latifolia - by drying, cutting steam heating, cooling, adding nutrients and Bacillus microorganism to ferment the medium, and drying the prod.
YAMADA T 05.08.77-JA-093345
C03 (05.03.79) A01n-07/02 C05f-11/08 C05g-03/04 C12k-01 C12k-03

Process comprises subjecting Zizania latifolia (gramineous weed) to drying, cutting and steam-heating; after cooling, adding nutrients to form a medium; inoculating microorganism belonging to the genus Bacillus to ferment the medium; and drying the fermented product and then formulating as powder or granule.

The microorganism propagates in the soil and makes the soil weakly alkaline when the product is applied to the soil. The product has high fertilising effect. Specifically, drying is conducted to water content about 10%. Cutting is to size 1-2 mm. Thus dried and cut weed is pulverised to the size 2 mm, and heated for 30-60 mins. by 120-150° C super-heated vapour. Thus swollen weed is treated with sodium hydroxide to decompose silicate contained in the weed, followed by neutralisation with sulphuric acid. Nutrients include, e.g., meat extract, bee honey, etc. Fermentation is conducted for about 1-3 months. 5.8.77 as 093345 (2pp108)

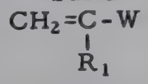
**Stabilized enzyme compsns - comprising bacterial cellular materi
covalently linked to particulate water insol polymeric material**
PFIZER INC 27.03.74-US-455143
*A96 B04 (26.04.78) *BE-827-033 C07g-07/02 + A61k-37/48*

Compsns. contg. immobilised bacterial cells wherein th
cells are covalently linked to particles of a water insol.
polymer matrix, have been prepd. They are used as sta
ilised insol. enzyme compsns. for use in enzymic react
ions. The amino group of the enzyme reacts with a free
group, e.g. epoxide, halocarbonyl or halomethylcarbony
of the polymer to form a covalent bond. Suitable enzyme
include glucose oxidase, penicillin-acylase, phenylalanin
ammonia-lyase and aspartate-ammonia lyase.

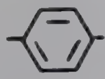
The enzyme may be reacted with the polymer direct o
by reaction with a monomer, e.g. an unsatd. ethylenic
monomer, followed by polymerisation. The enzyme may
be reacted with a cross-linking agent prior to covalent b
formation and polymerisation.

Suitable ethylenic monomers are of formula:-



$CH_2{=}\underset{R_1}{\underset{|}{C}}{-}W$

(where R_1 = H, Me or Cl; W = $-SO_2Cl$;



$-SO_2Cl$; $-COR_2$ or $-COX\text{-}(Y\text{-}X')_n\text{-}Z$; R_2 = halo,
azido, 2,3-epoxypropoxy, 2,3-epithiopropoxy, N-(2,3-
epoxypropyl) amino, chloride of p-diazoniumphenylaminc
acryloyloxy, lower alkoxycarbonyloxy or benzenesulphon
oxy; X = O or NR_3; R_3 = H or 1-6C alkyl; Y = 2 or 3C alk
ene; n = 1 or 2; Z = haloacetyl, 2-(4,6-dichloro)-s-tri-
azinyl, p-toluenesulphonyl p-(halomethyl) benzoyl or CN
and X' is the same as X with the restriction that when Z
p-toluenesulphonyl then X' = O).

Gas circulation system with gas flow sheet - having tapered holes for flow gas through sheet

DEUTSCH D H 19.08.77-US-826270
J04 Q56 (03.04.79) F04b-39

Gas circulation system comprises a sheet of gas impermeable material which is sealed gas tight across a conduit. The sheet has a thickness of between 0.001 μ and 3 mm thick and contains a no. of tapered holes for the flow of gas through the sheet. The holes are tapered in the same direction so that all the smaller openings are either on one side or the other side of the sheet.

The distance across the smaller openings is less than the mean free path of the gas molecules which are to be employed in the system under the operating conditions of temp. and pressure. The no. and size of the holes are such that the mean absolute effusional resistance coeff. of the wall is between 10^{-4} and 2.0 under the operating conditions.

Used in (I) in bacteriological fermentation reactions for introducing air or other gases into a chamber at a controlled rate; and (2) In the depollution of industrial smoke stack gases (treatment). Arrangement avoids the use of pumps and compressors which can give rise to impurities caused by the presence of lubricants. 19.8.77 as 826270 (11pp67).

SUMO D16 67330A/38 =US 4147-592

Antithrombotic and antitumour-potentiator urokinase purificn. - by adsorption of impurities on ionic pullulan gel

SUMITOMO CHEMICAL KK 10.03.77-JA-026726
*B04 (03.04.79) *DT2809-330 C07g-07/02*

The purificn. of urokinase comprises contacting a crude aq. soln. of urokinase with an ionic pullulan gel at pH 6.0-9.0 and recovering pure urokinase soln..

Pref. the contacting is effected using an ionic pullulan gel of water regain of 1.0-20 g per g of dry gel and an ion exchange capacity of 1-4 meq./g. Pref. the gel has diethyl amino ethyl gps. in ion exchangers.

Harmful impurities such as pyrogens and colouring matter can be removed. 6.3.78 as 883746 (4pp964).

AJIN D16 14881B/08 =US 4147-692

7-Glycyl:propylamino-4-methyl:coumarin - useful as fluorescent material (intermediate) for measuring enzyme activity

AJINOMOTO KK 16.06.77-JA-071469 (26.02.77-JA-020663)
*B04 E13 R16 (B02) (03.04.79) *J54005-976 +C07c-103/52*

7-Glycyl-prolylamino-4-methylcoumarin and acid salts, partic. with proline residue in L-form, are useful fluorogenic substrates for determn. of enzymatic activity.

Enzymatic activity of X-prolyl dipeptidyl-amino peptidase is determined by measuring amt. of 7-amino-4-methylcoumarin formed by enzymatic hydrolysis of 7-glycyl-L-prolylamino-4-methylcoumarin. Rate of hydrolysis is proportional to amt. of enzyme present. Fluoroescence intensity of 7-amino-4-methyl-coumarin is 30 times greater than that of 7-glycyl-L-prolylamino-4-methylcoumarin.

Partic. useful in diagnosis of hepatic and malignant disease. Novel N-endo protected derivs. of 7-glycyl-prolylamino-4-methylcoumarin are useful intermediates in synthesis of the substrates. 17.2.78 as 878826 (3pp).

FINN- D16 51646A/29 =US 4147-752

Immunological determn. and enzymatic reactions - using ring-shaped coated body, to fit test-tube etc. coated with e.g. antibody, antigen, protein, hapten or enzyme

Increasing the immunogenicity of an antigen - by combination of a antigenic material with the antigen

NATIONAL RES DEV CORP 28.09.77-GB-040339

B04 C03 (05.04.79) A61k-39

D/S: N(CH, DT, SW, US) + E(CH, DT, FR, GB, SW).

An immunologically active prepn. for human or veterinar use comprises an antigenic material in combination with an MHC antigen.

An antigenic material in combination with an MHC antigen, e.g. an HLA antigen or an analogous MHC antige of another animal species is new.

The MHC antigen may be in the form of an MHC-B2M complex and is bound to the antigenic material through th B2M-portion of the complex. Pref. the antigenic materia is a bacterial or viral antigen; a hormone peptide; a bacterial toxin or toxoid such as diphtheria toxoid; or HCG.

MHC antigen enhances the immunogenicity of the antigen material with which it is combined. Thus, immunisation procedures may be simplified, the amts. of antigenic material required may be reduced and the response to a given quantity of antigenic material is amplified.

27.9.78 as GB0016 (22pp954).

Treatment of extracellular Arthrobacter stabilis polysaccharide(s) - to increase soln. viscosity, by acidification, drying, and heating

US SEC OF AGRICULTURE 17.06.77-US-807620

(D16) (27.03.79) C07h-01/08

Method of treating the extracellular heteropolysaccharide (I) produced by Arthrobacter stabilis NRRL B-3225 is described: (a) (I) in its acidified form is dried to <25% H_2O (dry wt. basis); (b) dried (I) is heated for 5-130 mins. at 80-100°.

Method increases the viscosity of aq. solns. of (I) by more than 350% over known solns. (US 3632570). (I) is potentially useful as a thickening and suspending agent in aq. solns., and the method does not affect the compatability and viscostability in the presence of salts, acids, etc. 17.6.77 as 807620 (4pp478).

MAYO/ ★ D17 29580B/15 ★US 4147-557

Sugar cane mill with rake feed conveyor - where sweeping incline with gated aperture provide selective by/pass of station

MAYO A R 03.02.78-US-874933

(03.04.79) C13d-01/02

In a sugar mill a mixture of cane stalks, bagasse, juice and water is advanced up an inclined surface by a rake conveyor which separates the product into a series of longitudinally spaced packages. An aperture through the inclined surface may be closed by a sliding gate driven by a control. Typically the control activates the gate to allow alternate product packages to fall through the aperture.

Those packages which fall through the aperture are received by a belt conveyor which advances them to one stage of the sugar mill. Those packages which pass over the aperture are discharged into a chute at the upper end of the inclined surface and pass to a downstream stage of the sugar mill.

The gated aperture allows one stage of a sugar mill to be bypassed selectively e.g. to halve the product load supplied to it. This prevents overload and permits total bypass of a defective milling stage. 3.2.78 as 874933 (15pp295).

ly with a layer of alkali metal silicate, and with a materia
to lower the pH of the silicate.

The cigarettes are flame retardant according to the Flammable Fabrics Act Test No. DOC FF-4-72, i.e. a smouldering cigarette will not ignite a mattress with cotton ticking and batting within one minute. The smoke does not have the unpleasant taste which results when alkali silicate is used alone. The cigarettes yield more puffs per unit length, do not drop ash so easily, and do no
stick in processing machinery. 17.3.77 as 778665 (7pp955

PHIM D18 80461A/45 =US 4146-04
Cigarette wrapping material esp. paper - coloured brown wi
insoluble humate and washed to remove all soluble humate
PHILIP MORRIS INC 28.04.77-US-791896
*F09 P15 (27.03.79) *DT2817-775 +A24d-15/03*

Prepn. of brown cigarette papers comprises (a) staining the paper with a sol. humate salt; (b) fixing the humate or the paper by ion exchange to render it insol. and (c) washing the fixed paper to remove sol. salts formed during th
ion exchange step. Pref. an alkali metal humate is used and it is rendered insol. on the paper by ion exchange wit
an alkaline earth metal.

The paper has a reduced content of sodium ions and th
amt. of gas phase constituents such as carbon monoxide i
reduced. 28.4.77 as 791896 (6pp918).

ICIL D18 09601X/06 =US 4147-17
Smoking mixt. compsn. - contains a dispersed smectite to produce
firmer ash and to retard burning rate
IMPERIAL CHEM INDS LTD 16.07.74-GB-031426
*A97 P15 (03.04.79) *DT2531-127 +A24d-01/18*

Mfr. of a smoking material comprises dispersing a smectite in water by agitation to produce a slurry having a viscosity not less than that of a slurry obtd. from the same smetcite and water by agitation at 15°C with an energy input of 0.04 J/g/sec until a max. visoosity is reached, mixing the slurry with a combustible film forming binder and inorganic filler and making the slurry into a form from which a tobacco-simulating material can be obtd..

Fine dispersion gives improved ash coherence and greater combustion retardance by the smectite. The materials have low air porosity. 14.6.77 as 806377 (+ 8.7.75 - US - 594086) (6pp982).

kin moisturising compsn. - contg. polyethoxylated alcohol, olyethoxylated glycoside, soluble salt, and urea or aminoacid

FABERGE INC 14.10.76-US-732461

A96 E19 (A25) (27.03.79) A61k-07/48

A skin moisturising compsn. contains 30-60 wt. % of a olyethoxylated 12-20C fatty alcohol (I) contg. 6-30 ethoxy ps. per molecule, 15-35 wt. % polyethoxylated glycoside II) having 6-15 ethoxy gps. per molecule, 0.01-5 wt. % of n alkali or alkaline earth metal chloride, phosphate, cit-rate, formate, acetate or lactate (III), and 0.01-5 wt. % of urea or a 2-6C amino acid (IV).

The compsns. soften and smooth the skin, without leav-ing a greasy film. 14.10.76 as 732461 (3pp955).

DIAS ★ D21 29602B/15 ★US 4147-605

Prodn. of silica and other sols - by electrodialysis of alkali metal salts of oxide s) of the element

DIAMOND SHAMROCK CORP 14.04.77-US-787314 (22.03.76-US-669188)

E37 J03 L02 (03.04.79) B01d-13/02

A process is claimed for producing a sol. of Si, Al, Sb, Cr, Mn, Mo, Sn or W in an electrodialytic cell with a cation exchange membrane separating the anode and cathode compartments. A catholyte contg. $\gtrapprox$ 5% NaOH is supplied to the cell. A 0.1-5.0% (as metal oxide) aq. soln. of a water soluble alkali metal salt of the oxide of the element from which the sol. is to be made, is introduced into a reservoir from where it is circulated as anolyte through the anode compartment of the cell. The pH of the anolyte is controlled continuously to 7.5-8.5 for Si, 9.5-10.5 for Sb, 2.5-3.5 for Mo and 10.3-10.8 for Sn.

Glass beads are provided in the anolyte compartment which are fluidised to impinge of the anode to reduce the deposition of the element on it. A current of $>1/8$ amp /inch^2 is passed between the electrodes to cause migration of the alkali metal cations from the alkali metal salt from the anode compartment to the cathode compartment whilst preventing migration of metal oxide into the cathode compartment. The sol. produced is removed from the anode compartment when it is reached a particle size of $>$ 13 millimicrons and a concn. of >8 wt %.

Process allows electrodialytic prodn. of sols. useful e.g. as binders for making stools for cooling hot ingots in the steel industry, as binders for precision casting moulds, as anti-slip agents in floor polishes, and as abrasives in toothpaste. 14.4.77 as 787314 (6pp513)

Wax based stick applicator prodn. - with remelting step to eliminate shrinkage cavities, esp. for antiperspirants

BRISTOL MYERS CO 24.07.78-US-927438

(03.04.79) B29c-05 B29f-05

Wax-based stick applicator contg. distributed ingredients (A) is made by first pouring a melt of (A) and the wax into an open dispenser container. The melt is cooled until semi-solid, then a hollow tubular probe inserted near the centre of the surface of the mass, to such a depth that it touches any voids. The probe is then withdrawn thus forming a central cavity. The mass is heated to melt it so that it flows and fills up this cavity. Pref. the probe is inserted to a depth of 0.75-2 inches.

Used esp. for antiperspirant sticks but also for deodorants, hair colours, furniture waxes etc.. The formation of holes inside the stick is prevented. 24.7.78 as 927438 (5pp1251).

WACK D21 69080Y/39 =US 4147-760

Disperse silica having increased thickening activity - prepd. by treating pyrogenic silica with silicon tetrachloride, hydrolysing and deacidifying

WACKER CHEMIE GMBH 08.03.76-DT-609487

*A60 E36 G01 (03.04.79) *DT2609-487 C01b-33/12 C09c-01/28*

Highly dispersed SiO_2 with improved thickening action is produced by treatment of pyrogenically produced silicic acid. Process comprises (a) preparing silicic acid by flame hydrolysis from silicon halides; (b) sepg. the silicic acid from generated gases; (c) reacting the acid with 2 - 10 wt.% of $SiCl_4$ calculated on silicic acid, while optionally/mechanically stirring; and (d) hydrolysing the product by means of an air/water vapour mixture, and finally deacifying to obtain the SiO_2 improved thickening action.

The thickening agent is useful for a variety of purposes, e.g. as additive for preparations of dental hygiene. 22.2.77 as 770338 (5pp).

ARMO D21 00386A/01 =US 4147-766

Safe decodorant aerosol particles - formed by spray drying soln. forced through a spinning sintered metal ring filter

ARMOUR PHAR CO 09.06.76-US-694419

*A31 J04 +P33 Q76 (03.04.79) *DT2725-754 A61k-07/38 +A61j-03/07*

Hollow, thick-walled macrospherical particles consist of anti-perspirant material, $\geqslant$85% of the particles having diameters $>15\mu$ and few of the particles having diameters $>74\ \mu$, and having a true density >1. The walls are thick enough to withstand slipping, handling and dispensing without fragmentation into smaller particles which may be respired and retained in the lungs.

An appts. for producing the particles comprises a centrifugal atomiser having a porous sintered metal filter ring rotated inside a spray drying chamber. 9.6.76 as 694419 (10pp976).

E17 (03.04.79) C07g-179/10

Satd. 6-16C aliphatic diperoxydicarboxylic acids (I) are prepd. by reacting the corresp. dicarboxylic acid (II) with 2-5 (3-4) moles H_2O_2 in H_3PO_4 as reaction medium. Enough H_3PO_4 is used to give a stirrable mixt. and to dissolve (II) at 60-100°C. The resulting reaction slurry is then stirred at 20-70°C and (I) recovered.

Pref. the H_2O_2 concn. is $\geqslant 65\%$ and the H_3PO_4 concn. 85-95%, with (II):H_3PO_4 mole ratio esp. 1:8-12. Where (II) has $\geqslant 12C$ the medium pref. contains $\not> 5$ wt.% of a stronger acid e.g. H_2SO_4, CH_3SO_3H, CF_3SO_3H or toluenesulphonic acid.

(I) are useful as catalysts and as oxidising, bleaching and disinfecting agents. Safer reaction carries less risk of explosion c.f. use of H_2SO_4 as reaction medium. Traces of H_3PO_4 can be tolerated in the prod. without affecting its stability. 30.12.77 as 866091 (6pp1251).

Topical compsns. contg. vanillin, ethanol salicylic acid etc. - useful for treating dermatitis including tinea pedis or athlete's foot
SCHOLL INC 27.12.76-US-754694
B05 C03 P34 (03.04.79) A01n-09/02 A61k-31/61 A61l-09/04

An antimicrobial compsn. having antibacterial and antifungal activities for treating dermatitis including tinea pedis, comprises a liquid including water, ethanol, silicylic acid, benzocaine, and $\geqslant 2.5$ % of vanillin.

The compsn. is useful for treating dermatitis of the nature of tinea pedis or athlete's foot, and has activity against e.g. Candida, Trichophyten and other Gram-positive and Gram-negative bacteria. It may be applied to the foot as a cream, gel, powder, liquid, aerosol etc..

Pref. concn. of vanillin in the compsn. is 2.5-20%, it is solid and sublimes and when used on the foot it condenses in the footwear to affect the disease and lend deodorisation and sanitisation of the footwear. Dermatitis of athlete's foot can also be treated with the compsn. by using a controlled release dispenser. 27.12.76 as 754694 (4pp957).

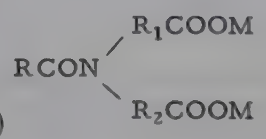
Solid detergent having reduced irritation and improved lathering comprises long chain N-acyl:imino di:basic carboxylic acid
KAWAKEN FINE CHEM K 12.08.77-JA-096708
E19 (06.03.79) C11d-01/10

A solid detergent contains a salt of a long-chain N-acylimino dibasic carboxylic acid having formula (I).



$$RCON\begin{cases}R_1COOM\\R_2COOM\end{cases}$$

(I)

In the formula, RCO is a 8-22C satd. or unsatd. fatty acid residue, R_1 and R_2 are the same or different 1-3C straight or branched chain alkylene, M is alkali metal, ammonium, cationic residue of an alkanolamine, o a cationic residue of a basic amino acid, M' is H, alkali metal, ammonium, cationic residue of alkanolamine, or cationic residue of a basic aminoacid). (I) is long-chai N-acylimino diacetate or dipropionate, or long-chain N-acyl-3:3'- iminodibutyrate.

The solid detergent prepd. from long chain N-acylglutaminate, as a base material has inferior properties. T new detergent has lower irritation effect and superior su ability for processing. Lathering and shape retaining pr perties are improved.

Pref. long-chain N-acyliminodicarboxylate is alkali metal salt, alkanol-amine salt (monoethanolamine, triethanolamine salt etc.), or basic aminoacid salt (lysine, ornithine, arginine salt, etc.) of longchain N-acylimino diacetate, -dipropionate, -dibutyrate, etc. The N-long-chain acyl is caprylic, aluric, myristic, palmitic, oleic acid gp. etc. 12.8.77 as 096708 (8pp126)

BASIC NUMBER INDEX (V)

Weekly by section and overall, lists all entries by accession number. Each heading consists of the accession number in bold, followed by the CPI section letters. There then follows a list of all the family members, commencing with the basic and finishing with the current week's patent. For each family member the CPI week of issue is quoted, and a plus sign indicates that a multiple priority has been claimed.

PATENT NUMBER INDEX (VII)

Weekly by section and overall. Lists left to right the patent type (* for basic, = for equivalent or # sign for non-convention equivalent or where the priority has been artificially "added" to the specification), patent number, accession number and CPI classes.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

MANUAL CODE INDEX

IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the norma DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry
A+	Polymer Applns.
AE	Polymer & General Chemistry
B	Pharmaceuticals

Copies of Specifications may be ordered from our PATENTS SUPPLY DIVISION.

EUROPEAN PATENTS REPORT
PCT PATENTS REPORT

New publications in the World Patents Abstracts service provide detailed, documentation-type abstracts, with drawings, of **all EPO and PCT** applications within **14 days** of publication. Also reported with the **designated states**, and references cited in the **international search report.**

Annual subscription costs :—

European Patents Report	:	£250, $525 or Y 95,000
PCT Patents Report	:	£100, $210 or Y 38,000

As support documentation the abstracts and complete specifications are available on **microfilm.**
Descriptive brochures giving complete price list, and specimen copies, are available on request from the Subscription Department.

London WC1X 8RP

D1: FOOD; FERMENTATION

D11 : BAKING

STAM- ★ D11 29793B/16 ★BE -872-743
Bakery prod. partic crisp biscuit with high bran content - facilitates anti:constipation diet with prescribed daily bran intake
STAMAG STADLAUER AG 22.12.77-OE-009226
(30.03.79) A21d

A mixt. is prepd. contg. pts. wt. as follows:- rye or wheat bran - 100; water - between 200 and 500, but pref. $\geqslant$250; vegetable thickeners 2.5-15; plus conventional additives such as raising and acidifying agents as well as salt, flavourings, linseed, sesame, etc. The mixt. produces a paste which is formed, e.g. rolled or moulded, and baked.

The bran can be finely or coarsely ground The vegetable thickeners pref. consist of 5-10 pts. wt. carob seed The paste is pref. rolled out to a thin sheet before baking to provide a prod. which is $<$1 cm thick. Yeast is pref. added as raising agent as well as a little sugar. While the paste is in sheet form it is pref. formed as a biscuit and then baked to make a crisp, crunchy prod.

Used in mfr. of biscuits and similar edible prods. having a high content of bran, partic. suitable for inclusion in diets for the treatment of constipation, diverticulosis, etc. Facilitates the regular, prescribed intake of bran on a daily basis by providing a tasty, compact, bran-rich biscuit or similar prod. 13.12.78 as 872743 (10pp448)

JAPU/ ★ D11 B/16 ★BR 7704-798
Maize flour roasting equipment - extracts prod. from oven plate by scraper conveyor and cleans remainder by air jets
CIERO JAPUR C 20.07.77-BR-004798
(03.04.79) A21d-06

KEMP/ D11 34774V/19 =DS 2249-383
Dough portion conveyor system - using pivoted trays with stability guides along top horizontal run used for simultaneous tilting of multiple trays
KEMPER K 09.10.72-DT-249383 (00.00.72-DT-202633)
*+Q35 (12.04.79) *DT2249-383 +A21c-09/08*

A dough processing plant consisting of a dough dividing and kneading machine, joined by an endless chain trough conveyor to a rolling-out station, was described in the Parent Patent. A number of troughs with the dough lumps is tipped simultaneously by long horizontal channels which can be moved up and down. A guide roller at the end of a crank, attached to each trough, rolls inside this guide channel and causes the trough to be tipped when the crank is turned from 45° above to 45° below the horizontal

This is a more reliable way of tilting than just gravity, as described in the Parent Patent. 9.10.72 as 249383 Add to 2202633 (6pp39).

SEEW- D11 82342A/46 =DS 2718-383
Dough strip winding up device - with automatic release of thrust belt return pulley to initiate strip winding up (NL 30.10.78)
SEEWER AG 26.04.77-DT-718383
*(12.04.79) *DT2718-383 A21c-03/02*

A reel to wind up a rolled-out strand of dough has below the discharge end of the feed conveyor an endless belt which is guided over three pulleys in an L-arrangement. The top pulley is pivoted. The reel on which the strand is rolled up is enveloped by the concave part of the conveyor and is urged against it by another endless belt on the opposite side. As the dough strand is wound up, the reel can rise because its stub shafts rest in two slots. On rising, the reel actuates a trip which swings the top pulley clear.

This saves the person needed to give the dough strand a start on the reel and saves having to stop the machinery. 26.4.77 as 718383 (8pp39).

FUCH/ ★ D11 29909B/16 ★DT 2744-756
Fully automatic dough kneading and dividing machine - with piston extruder and eccentric kneading rotors in stators
FUCHS M 05.10.77-DT-744756
(12.04.79) A21c-05

Fully automatic dough dividing and kneading machine has at the bottom of a dough funnel a chamber in which a piston can reciprocate and extrude the dough through four dies. A parting knife cuts off the emerging dough strands and the pieces are taken by a belt conveyor to four separate but banked circular kneading machines, each consisting of a stator and an eccentric roller.

The design is fully automatic, yet compact and can be produced at low cost for small and medium sized establishments. The gentle kneading action makes it ideal for bread rolls. 5.10.77 as 744756 (19pp39)

GRUB/ ★ D11 29912B/16 ★DT 2744-807
Dough dividing machine - with light beam barrier actuating blade cutting dough between storage and filling funnels
GRUBELNIK H 05.10.77-DT-744807 (00.00.73-DT-338830)
(12.04.79) A21c-05

The parent patent dough dividing machine is modified by arranging a blade between the discharge opening of the storage funnel and the feed opening of the filling funnel for the dividing drum. A feeler responds to the dough movement and the blade is actuated as soon as the discharge rolls are inoperative.

This cuts the cohesion of the dough strand between the two funnels and enables the cut-off dough in the filling funnel to charge the dividing drum pockets more satisfactorily. Specifically the discharge opening of the dough storage funnel is surmounted by feed rollers. A light beam barrier stops the rolls when the dough overflows the top edge of the filling funnel for the dividing drum. The light beam barrier also actuates a blade which severs the dough in the filling funnel from that in the storage funnel. 5.10.77 as 744807 Add to 2338830 (8pp39)

COST/ ★ D11 29985B/16 ★DT 2841-199
Kneading machine for food e.g. bread dough - with rotating and turning stirrer and trough lifted and tilted by rope drive
COSTA R 07.03.78-IT-067472 (10.10.77-IT-069246)
(12.04.79) A21c-01/02 B01f-13

A kneading machine for bread dough or other food includes an annular trough which a stirring mechanism which can revolve and turn on an arm in the trough centre. A rope mechanism lifts the trough first vertically up from a casing on slideways until stops end the vertical motion and continue rope-pull tips the trough over.

This is an ideal machine for restricted space and for easy access to the trough. It saves the labour for discharging the kneaded material and is inexpensive enough for use by small tradesmen. 22.9.78 as 841199 (12pp39)

HOLM/ ★ D11 30111B/16 ★GB 1544-525
Composite baking mould formed of extruded metal sections - with slanted walls for ease of removal of baked prod.
HOLMQVIST M A 14.04.76-GB-015237 (13.12.73-SW-016830)
(19.04.79) A21b-03

The mould has a number of individual mould spaces and is formed from an elongate section, and bar, both of extruded light metal. The metal section has a roughly U-shaped cross-section.

The mould is formed of two spaced side walls cut from the bar, and a number of parallel spaced section elements cut from the elongated section at a slant to give a wider top than base. The side walls are welded or riveted to the ends of the section elements. Thus the section elements form the bases and sidewalls of the individual mould spac-

The baking tray is formed with individual mould spaces in which dough, e.g. bread, can be baked. The shaping of the mould spaces makes it easy to remove the baked loaves. 14.4.76 as 015237 Add to 1436476 (7pp295)

Bread testing appts. - with electromagnet and differential transformer measuring overall and elastic deformation
MOSC FOOD IND TECHN 05.07.76-SU-382014
R16 (06.05.78) G01n-03/42

An instrument to determine the structural properties of foodstuffs, e.g. bread and other semifinished prods. of the baking industry, has been designed to measure the overall and the plastic deformation with greater accuracy.

It is equipped with an electromagnet which can be switched on by a push button. Its armature can compress a spring by a disc and is fixed at the other end to a dashpot. A pad at the end of the core of a differential transformer coil is applied to the bread surface.

The total deformation is measured by the depth to which the pad has been pressed in by the spring after it has been compressed and then released. This is read on a scale. The elastic deformation is calculated by deducting from the total the plastic deformation which is detected by the end produced by the core.

Nitrogenous animal feeds contain a mixt. of urea phosphate (I) and defluorinated rock phosphate (II) in a wt. ratio of 0.1-10:1, opt. together with other components, minerals or vitamins.

The feeds can be used as additives forpelleted concentrates, as cattle licks or as siliage additives. Components (I) and (II) do not react with each other; the soluble P content remains high for long periods; the Ca:P ratio can be adjusted to the optimum value; (I) produces lower flood ammonia levels than urea. 22.5.78 as 822279 (15pp367)

KURE ★ D13 29978B/16 ★ DT 2840-791
Ethylene adsorbent of active carbon - treated with metal cpds. to increase capacity
KUREHA KAGAKU KOGYO 22.09.77-JA-114057
E17 J01 (12.04.79) B01d-53/02

Absorbent for ethylene made by treating active carbon with Cu, Fe, Co and/or Ni, or their salts, in presence of HNO_3 and heating the mixt. at 150-900°C under inert gas, to give a product contg. 0.01-20 (0.1-10) wt.% of metal.

Used for the removal of ethylene (which has an anaesthetic action) from the atmos. and control of the fruit-ripening process which evolves ethylene, to prolong storage. Absorption capacity of the carbon is greatly increased, esp. when used in higher concns. of ethylene. Higher hydrocarbons are also adsorbed. 20.9.78 as 840791 (20pp195)

FRIT- ★ D13 30034B/16 ★ DT 2843-322
Prepn. of aroma material esp. cocoa substitute or extender - by heating whey solids and water under pressure; cooling and spray-drying
FRITZSCHE DODGE 04.10.77-US-839208
(12.04.79) A23c-21 A23l-01/22

Aromat extender or aromatising material is prepd. by (i) heating a mixt. contg. a larger proportion, e.g. 80-90 wt.% of whey solids and a smaller proportion e.g. 20-10 wt.% water for at least a few min. inder a sufficiently high pressure to keep the water in the heated mixt. in the liq. phase; (ii) cooling the mixt. obtd., e.g. to < 100°C, and pref. (iii) drying to < 10 wt.% moisture content.

The treated whey solids are used as food or drink components, esp. in 1-25 wt.% concn., partic. in cocoa, coffee or malt compsns. The prods. have chocolate astringency, bitterness and colour, and may be used as cocoa substituents or modifier. The whey solids may also be used in tobacco industry, in prepn. or processing of 'casing' sauce for Burley tobacco. 4.10.78 as 843322 (14pp200)

E17 (D15 D16) (09.03.79) A23l-01 B01d-19/04

Defoaming agent (I) contains (i) sorbitan fatty acid ester (II), propylene glycol (III) and glycerin fatty acid ester (IV), and (ii) vegetable oil (V), as essential components.

Pref. compsn. for (I) is (V); 30-60 wt.%, (II); 40-60 wt.%, (IV); 5-20 wt.%, (III); 0.03-5 wt.%. As (V), rapeseed oil, soy bean oil, rice bran oil, peanut oil, cotton oil, olive oil and others are used. The fatty acid component in (II) and (IV) are lauric acid, palmitic acid, oleic acid and stearic acid.

(I) can be used in foods. (I) is transparent and has durable defoaming activity. (I) is used in industries of food-prodn., fermentation and brewing, treatment of waste water etc. 17.8.77 as 098522 (4pp42)

MOMI ★ D13 30698B/16 ★J5 4032-643
Easily-boiled unpolished rice prepn. - by drying while fluidised and rapidly cooling to form cracks
MORINAGA & CO LTD 10.08.77-JA-094950
(10.03.79) A23l-01/10

Method comprises drying unpolished rice by fluidising at 105-130°C for 10-30 mins. and rapidly cooling to $<$30°C to form cracks. The prod. can be easily boiled as polished rice using an automatic rice cooker.

As cracks are formed between aleurone layer and pericarp, water is easily impregnated in whole albumen. Pref. drying is practiced to a moisture content of 6-11% with hot air. 10.8.77 as 094950 (3pp5)

KYOW ★ D13 30699B/16 ★J5 4032-644
Deodorising proteins esp. soybeans - by treating with aldehyde oxidase and opt. alcohol dehydrogenase in presence of electron acceptor
KYOWA FERMENTATION KK 19.08.77-JA-099143
(D16) (10.03.79) A23l-01/20

Method comprises treating the protein, in the presence of an electron acceptor, either with aldehyde oxidase or with alcohol dehydrogenase and aldehyde oxidase. The electron acceptor may be oxygen, potassium ferricyanide, methylene blue or 2,6-dichlorophenol-indophenol. The enzymic reaction is at 20-40°C at pH 6-10 using 0.001-1 unit enzyme per gram of protein. The enzymic reaction using alcoho dehydrogenase requires a hydrogen acceptor and β-DNA$^+$ or a yeast body contg. β-DNA$^+$ can be used as the hydrogen acceptor. 19.8.77 as 099143 (5pp5)

KYOW ★ D13 30700B/16 ★J5 4032-645
Deodorising proteins esp. soybeans - by treating with aldehyde dehydrogenase and opt. alcohol dehydrogenase in presence of hydrogen acceptor
KYOWA FERMENTATION KK 19.08.77-JA-099142
(D16) (10.03.79) A23l-01/20

Method comprises treating protein, in the presence of a hydrogen acceptor, either with aldehyde dehydrogenase or with alcohol dehydrogenase and aldehyde dehydrogenase. Using aldehyde dehydrogenase, the odorous aldehydes can be converted to odourless acids, and by using alcohol dehydrogenase together not only aldehydes but also alcohols can be converted to odourless acids and not only free aldehydes but also the aldehydes bonded to protein can be converted to free acids.

The enzymic reaction using alcohol dehydrogenase and aldehyde dehydrogenase requires a hydrogen acceptor, e.g β-DNA$^+$ or a yeast body contg. β-DNA$^+$. The enzymic reaction is at 20-40°C at pH 6-10 (8.5-9.5) using 0.001-1 unit enzyme per gram of protein. 19.8.77 as 099142 (7pp5

Carbamide-based feed for ruminants - is prepd. by extruding mixt. of carbamide, starch contg. substance and zeolite as adsorbent for ammonia and moisture

DYAKOV I P 01.04.76-SU-343617

C03 (11.05.78) A23k-01

Carbamide-based feed for ruminants is prepd. by extrusion of a mixt. contg. carbamide (as a source of nitrogen) starch-contg. substance (as a source of energy for the assimulation of nitrogen by ruminants) and a substance which adsorbing moisture and ammonia. The process is improved by using 3-10 wt.% (w.r.t. the total mixt) of a zeolite as an adsorbent (particle size 80-100u; moisture content 5-8%) and carrying out the extrusion at 100-120 °C under a press. of 15-20 kg/cm^2. By this method, the ammonia loss during the extrusion is decreased. The high press. (higher than in the conventional process) promotes penetration of the particles of molten carbamide into the solubilised starch, whereby the quality of the prod. is improved.

Non-caking, dried potato granules prepn. - by washing, comminuting, sulphiting, squeezing, granulating and drying

POTATOE FOODS RES 28.12.76-SU-437068

(10.05.78) A23l-01/21

Potato granules are prepd. by washing and cleansing potatoes, pressing, comminuting and drying. The quality of the prod. is improved by subjecting the potatoes before the pressing, to sulphitation and then pressing to a residual moisture content of 52-55 °C. Subsequently the mixt. is granulated and the granules are granulated by rolling. The comminution is carried out before the sulphitation. The latter is performed with a soln. of $Na_2S_2O_4$ in the juice squeezed out from the potatoes during the pressing of the previous batch. The aim of the sulphitation is to prevent the ferminative oxidn. of the potato surface. During the rolling the granules are subjected to steaming to solubilise their surface. The technology is simplified compared with the known process.

Particle treatment system for drying foodstuffs - has gas flow system for fluidising particles on conveyor moving through treatment zone

WOLVERINE CORP 05.01.77-US-756896

J08 Q76 (29.08.78) F26b-17/04

Particle treatment system comprises a conveyor for transporting particulate material through a treatment zone an a gas flow system for fluidising particles on the conveyor as they move through the treatment zone. Alongside the treatment zone a gaseous stream is projected downwardly against and inwardly along the transport surface of the conveyor to provide a boundary sheath gas flow along the edge of the treatment zone.

Used in drying and roasting food prods., e.g. coffee beans and cereals, and dehydrating vegetables. The boundary sheath gas flow prevents particles from passing laterally out of the treatment zone and contributes to the fluidisation of particles at the side boundary of the treatment zone. 5.1.77 as 756896 (8pp67)

Combined aerobic and anaerobic sludge digestion - with first high temp. aerobic stage
UNION CARBIDE CORP 26.07.78-US-928099 (13.10.77-US-841902)
C04 (12.04.79) C02c

Sludges are digested by mixing in a first zone with a gas contg. ≥20 vol.% O_2 at a rate sufficient to aerobically digest the sludge while keeping a total suspended solids (TSS) content ≥20g/l. The internal temp. is 35-75°C and aerobic digestion is continued for 4-48 hrs. to reduce the content of volatile, biodegradable suspended solids (VBSS)

The partially stabilised sludge is then passed to an enclosed zone at 25-65°C where anaerobic fermentation takes place to reduce the VBSS content to <40% of the value in the feed to the first zone. The stabilised sludge and co-produced CH_4 gas are recovered.

A more efficient digestion is achieved compared with either aerobic or anaerobic fermentation alone; total treatment time is reduced; temp. control is improved; the size of the anerobic fermenter is reduced and more CH_4 is generated than is needed to provide process heat. 12.10.78 as 871214 Add. to 863735 (71pp1251)

Helium filled system for ambient heat recovery - using expansion-compression system to freeze out pure water from sea water
LECZKOWSKI K 11.10.77-DT-745700 (00.00.76-DT-654097)
J08 Q55 (12.04.79) F03g-07

Helium is used as the working fluid in the process described in DT 2654097. This is recycled without liquefaction. As shown on the temp.-entropy diagram, a clockwise cycle involves dropping to a low isenthalpic line. The cold for this process is supplied from a second anti-clockwise cycle.

Other gases such as H_2, Ne, O_2, N_2, CO, A, NO, hydro-carbons, CO_2, etc. can be used. For isothermal changes in the gas cycle, liq. working media can be used to stabilise the temp. Thus compressors etc. can be enclosed in vessels contg. such liquids, arranged to act as heat pipes.

Can be used to recover fresh water from sea water by refrigeration. It has the advantage that does not liquefy until close to 0°K and therefore can be completely cycled in the gaseous state. 11.10.77 as 745700 Add to 2654097 (16pp1053)

Evaporation of liquids in multi-effect system - having two or more effects at different pressures with vapour transfer between effects
SAARI R 12.09.77-SW-010213
J01 (12.04.79) B01d-03

Evapn. system for liquids uses $\geqslant 2$ effects operating at different temp. levels. Vapour from one is then used to heat liquid in the next. The liquid is evaporated in $\geqslant 1$ of the effects and is condensed in $\geqslant 2$ evapn. stages. The liquid being evaporated in one effect is recycled through the condensn. stage of the next effect which is operating at a higher pressure. In this way the liquor from the previous effect acts as the condenser coolant in the next.

Used esp. for evaporating sea water or effluent streams. Uses smaller equipment and is less susceptible to fouling than conventional multi-effect and vertical tube evaporators. 24.10.77 as 747582 (14pp1053)

Crusher-mixer for dissolving granular products - comprises hopper, crushing rolls, cavitation chamber and pumps, and is transportable for connection to existing installation
FRESAFOND J P G 12.07.77-FR-022161
J02 P41 (D16) (16.03.79) B01f-13/10 B02c-04/02

Crusher-mixer for dissolving powdered or granular prods which can be connected to an existing installation but which is independent of it, consists of a hopper fitted with crushing rollers and their driving mechanism and a cavitation chamber placed under the hopper. A suction pump and a delivery pump and their drives are mounted on a bracket on the side of the cavitation chamber.

The pumps are both connected to the vessel of the existing installation. The suction pump is connected on its delivery side to a nozzle opening into the cavitation chamber. The delivery pump is connected on its suction side to a strainer in the cavitation chamber.

Problems associated with the presence of lumps, with dissolving large quantities and with blockages are solved. The appts. breaks up lumps whatever their state or size, dissolves the materials rapidly and effectively and allows recycling until perfect dissolution to a desired concn. has been realised. It can be used for preparing surface treatment baths, treating waste waters, adding sugar to musts or any work necessitating a jet or emptying by suction. 12.7.77 as 022161 (10pp1192)

Treating ammonia- and phosphoric acid-contg. liquor - by contacting with basic metal cpd., opt. adding a calcium source and contacting with phosphoric acid-contg. material

EBARA INFILCO KK 10.08.77-JA-095915

(07.03.79) C02b-01/14 C02c-05/02

Ammonia and phosphoric acid are effectively removed from a waste water while suppressing the formation of scales as low as possible and maintaining the ammonia removing rate under high degree.

Process comprises contacting it with a metal hydroxide, oxide or carbonate, e.g. $Al(OH)_3$, Al_2O_3, $Mg(OH)_2$, MgO.CaO, $MgCO_3$, $CaCO_3$, $Mg(OH)_2.Ca(OH)_2$, $MgCO_3.Mg(OH)_2$, serpentine, calcined dolomite, limestone, calcined clinker, magnesia dinker etc. to remove alkali metal carbonate and simultaneously to convert ammonium salt into ammonia which is then removed by gas-liq. contact; opt. adding a Ca source, e.g. $CaCl_2$ etc.; and contacting it with granular H_3PO_4-contg. matter, e.g. phosphorus ore, coral sand, bone charcoal etc. opt. under fluidised state to remove dissolved H_3PO_4 component.

By removing the alkali metal carbonate, the deposition of $CaCO_3$ on the surfaces of the H_3PO_4-contg. granules is effectively suppressed, thereby the phosphorus removal is effectively carried-out. 10.8.77 as 095915 (4pp34)

ISHI- ★ D15 30203B/16 ★J5 4030-679

Removing noxious gases in fluidised layer incinerating furnace - by adding e.g. calcium hydroxide and charging sludge to incinerating furnace

ISHIGAKI KIKO KK 11.08.77-JA-097211

J09 Q73 (07.03.79) F23g-05

In incineration of a sludge, e.g. sewage sludge, industrial sludge and night soil sludge etc., contg. sulphur componenets in a fluidised layer incineration furnace, the improvement comprises previously adding $Ca(OH)_2$, dolomite hydrate or magnesia hydrate, etc. to the sludge to be incinerated in amts. of greater than the equiv. of combustible sulphur components contained in the sludge, and charging the sludge mixt. into the incinerating furnace so as to be combusted, so that the desulphurisation is carried-out in very high efficiency (90-95%).

By increasing the amt. of $Ca(OH)_2$, dolomite hydrate or magnesia hydrate to be added, harmful acidic gas generated in the combustion, e.g. HCl is neutralised simultaneously. The secondary in furnace reaction is carried-out under high temp. and fluidised state, so the reaction is carried out very rapidly even in solid phase-gas reaction, e.g. $Ca(OH)_2$-SO_2 reaction. 11.8.77 as 097211 (2pp34)

ISHI- ★ D15 30204B/16 ★J5 4030-680

Suppressing generation of noxious components in sludge incineration - by drying, admitting to fluidised medium under reducing atmos. and rapidly burning

ISHIGAKI KIKO KK 11.08.77-JA-097212

J09 Q73 (07.03.79) C02c-03 F23g-05

In incineration of a sludge contg. harmful matters, e.g. Cr^{6+} etc., e.g. sewage slude, industrial sludge etc. by admitting it into an inert medium fluidised under high temp. the improvement comprises initially drying the sludge until its water content becomes $\leqslant 40\%$, admitting the sludge into a fluidised-medium maintained under a reducing atmos. having the air ratio of 1.0-0.5 and under the gasifying temp. so as to be gasified, and combusting rapidly the gas under the air ratio of 1.05-1.25, so that the generation of harmful matters, e.g. Cr^{6+}, etc. and harmful gas, e.g. nitrogen oxides and sulphur oxides, etc. are effectively suppressed without necessitating any special installations.

The sludge is combusted under the air ratio and the temp. as low as possible due to the fact that the generation of Cr^{6+} and NOx is caused by a sufficient amt. of oxygen and high combustion temp. in the incineration. 11.8.77 as 097212 (2pp34)

AGEN ★ D15 30221B/16 ★J5 4030-892

Colorimetric determn. of phosphoric acid and arsenic acid ions - e.g. in river water, using reagent contg. molybdic acid in presence of reducing agent

AGENCY OF IND SCI TECH 12.08.77-JA-097220

E36 J04 R16 (E32) (07.03.79) G01n-31/22

Method of analysing phosphoric acid and arsenic acid ions comprises contacting a compsn. contg. molybdic acid in water-insol. state with a sample liq. contg. reducing agent or with a sample liq. and a reducing agent soln., and determining colourimetrically phosphoric acid and arsenic ions by colouration of the compsn. An agent for analysing phosphoric acid and aresenic acid ions consists of a compsn. contg. molybdic acid in water-insol. state, or the compsn. and an inert solid diluent.

Phosphoric acid and arsenic acid ions of ppb order can be determined by simple operation without requiring special tools or appts. and skillful technique. The concn. of phosphoric acid and arsenic acid ions in river water, sea water, etc. can be simply determined.

Molybdic acid in water-insol. state is water-insol. molybdate or molybdic acid adsorbed on anion-exchange resin. Solid diluent is e.g. silica gel, TiO_2 powder, etc. When phosphoric acid and arsenic acid ions are present in water, deep blue colour is formed by molybdic acid and the concn. of the blue colour is compared by eye or determined by absorptiometric method, etc. Reducing agent soln. is e.g. ascorbic acid aq. soln. 12.8.77 as 097220 (3pp50)

NIDR- ★ D15 30311B/16 ★J5 4031-083

Treatment of waste ozone scavenger - where amt. of hydrogen peroxide required is reduced by ensuring reaction between ozone and reagent in scavenger is completed

NIPPON DRY CHEM KK 30.07.77-JA-090997

E36 J01 (07.03.79) C02c-05/02

Treatment of waste ozone-scavenger (I) after removal of ozone (II) from a gas (III), is effected by (1) blowing (III) contg. (II) into the waste (I) under vigorous agitation, resulting in compketion of the reaction between (II) and reagent (IV) in (I) and (2) carrying out the reaction between (IV) and hydrogen peroxide (V)m by addn. of (V) to (I).

Usually a large amt. of unreacted (IV) remains in (I), such that a large excess of (I) must be used for complete removal of (II) from (I), when (I) is discarded, secondary pollution problems occur. If the unreacted (IV) is treated with (V), a large amt. of expensive (V) must be consumed In the method described the amt. of (V) can be reduced. 30.7.77 as 090997 (4pp42)

NIDS ★ D15 30312B/16 ★J5 4031-084

Regeneration of zeolite after absorption of ammoniacal nitrogen - by passing aq. ozone-contg. soln. through zeolite bed

NIPPON DENSHI ZAIRY 02.08.77-JA-092814

E33 J01 (07.03.79) B01d-15/06 C02c-05/02

Regeneration of zeolite (I) packed in a bed, after adsorption of ammoniacal nitrogen (II), comprises passing an aq. soln. (III) contg. ozone through (I)-bed, to decompose (II) into N_2 and water.

Pref. a small amt. of salts of Na, Ca and Mg is present in (III), because these metal ions can activate (I) by ion-exchange simultaneously with regeneration of (I).

When active carbon or activated clay is used for removal of (II) in waste water, it must be heated to decompose adsorbed (II) and this is costly. In the present method, (I) can be regenerated effectively and inexpensively. 2.8.77 as 092814 (4pp42)

EBAI ★ D15 30322B/16 ★J5 4031-098

Regenerating activated alumina granules contg. adsorbed silicic acid - by contacting with acidic or basic soln. and heat treating

EBARA INFILCO KK 12.08.77-JA-095990

E33 J01 (07.03.79) C01f-07/02

Regeneration of activated alumina (I) granules contg. adsorbed silicic acid (II) comprises elution of (II) by contact of (I) with acidic or basic soln. (III) and heat-treatment of (I) after sepn. from (III).

After contact of (I) with (III) and sepn. of (III), (I) is pref. treated by the following method: (1) when (I) is contacted with acidic (III), (I) is contacted with alkali reagent and basic water-sol. aluminium salt, such as sodium and potassium aluminate and (2) when (I) is contacted with basic (III), (I) is contacted with acid or acidic water-sol. aluminium salt, such as aluminium sulphate and chloride. After (1) or (2), (I) is washed with water.

Regenerated (I) is used for removing from water prior to use as feed-water in boilers. (I) can remove (II) with high efficiency. 12.8.77 as 095990 (3pp42)

Pretreating sample for COD determination - by removing free chlorine using column contg. activated metal

DENKI KAGAKU KEIKI 16.08.77-JA-097500

J04 R16 (08.03.79) G01n-01 G01n-31

Pretreatment of sample for the determination of chemical oxygen demand (COD) comprises passing acidified sample contg. free chlorine through a column filled with activated aluminium metal or alkaline earth metal and acidic desalted water.

Free chlorine in sample can be completely removed by simple method without causing change of COD component and COD value can be precisely determined. Also the amt. of consumption of column filler is advantageously small. The method is easily applicable to automatic determining appts. 16.8.77 as 097500 (5pp50)

Purificn. of waste water from human waste treatment - by pH adjustment with acid, froth sepn. and ozonisation

MITSUBISHI ELECTRIC CORP 12.08.77-JA-097272

(09.03.79) C02c-05/04

Water from the biological treatment or chemical oxidation treatment of human wastes is purified by subjecting to froth sepn. by aeration after adjusting to pH 3 to 5 using sulphuric acid or hydrochloric acid, and introducing into an ozonisation tank where the treated water is countercurrently contacted with an ozone contg. gas.

Method eliminates operational troubles due to frothing in the ozonisation treatment and thus reduces the amt. of ozone required. 12.8.77 as 097272 (4pp117)

MITC ★ D15 30448B/16 ★J5 4031-957

Treating hydroxy-acetone contg. waste water - by contacting with alkali and then with granular activated carbon

MITSUI PETROCHEM IND KK 16.08.77-JA-097466

A41 E17 (09.03.79) C02c-05/02

Method comprises contacting the waste water with an alkaline inorganic cpd., e.g., NaOH or KOH, to adjust the pH

Method not only effectively reduces the COD components present in hydroxyacetone-contg. waste water even in cold areas etc. but also is effective even where organics content in waste water change greatly. Thus, this method is applicable to treatment of waste water from the cumene process phenol-mfg. factory. 16.8.77 as 097466 (3pp117)

ASAG ★ D15 30449B/16 ★J5 4031-958

Reducing COD of waste water - by contacting with chlorine and supported metal peroxide to provide controlled amt. of hypochlorite

ASAHI GLASS KK 16.08.77-JA-097512

(09.03.79) C02c-05/04

Waste water contg. COD components, e.g. carboxylic acids, alcohols, phenols or saccharides, is treated by contacting with available chlorine and ≥1 of the peroxides of metals supported on activated alumina and/or silica gel in a proportion of 0.5-10 wt.%, e.g. Ni, CO, Cu, Mn, Zn, Ce, Pb, Mg, Al, Ba, Sr and Ti, at a pH of 6.5-8.5.

The method, requiring an amt. of hypochlorite which is equal to or in only slight excess of the COD components present in waste water, effectively treats high concns. of COD components at comparatively low cost. Method is applicable to the treatmnet of organic synthesis waste water, dyeing waste water, living refuse, gas-washing liquor, etc.

Pref. surface area and void space of the activated alumina and silica gel used are 100 to 500 m^2/g and 0.2 to 1.5 cc/g and 100-1000 m^2/g and 0.2 to 4.5 cc/g, respectively. 16.8.77 as 097512 (8pp117)

Preventing deactivation of activated sludge - during waste water treatment by adding Nocardia bacteria

AGENCY OF IND SCI TECH 15.08.77-JA-097672

(09.03.79) C02c-01/06

Bacterium, cultivations, sepd. bacterium, or other treated bacterium, capable of coagulating activated sludge, which belong to the family of Nocardia bacteria are added to ted sludge from deflocculation and bulking. The bacteria is applicable to all types of sludges concerning urban sewage, industrial effluents, hydrocarbons, human wastes, and other environmental contaminants. The Nocardia bacteria used include, besides Nacardia, erythropoles KR-256-2, FERM-P No. 3923, etc. 15.8.77 as 097672 (4pp117)

SHOW ★ D15 30453B/16 ★J5 4031-966

Activated sludge treatment method - effective in treating high BOD waste at higher volume load of BOD while minimising space

SHOW A DENKO KK 17.08.77-JA-097834

(09.03.79) C02c-01/06

Treatment of waste water rich in BOD components is claimed where (1) waste water is subjected to an aeration treatment under conditions of 9000-15000 ppm sludge concn. and 8-15 kg BOD/m^3/day vol. load to reduce BOD to $\leqslant$ 200 ppm; and (2) the treated waste water from the first stage is subjected to an aeration treatment at supplying rate such that the concn. of sludge and the vol. load of BOD is 1.5-2.5 kg BOD/m^3/day.

Method, featuring the effective treatment of high BOD waste water at the higher vol. load of BOD, is capable not only of minimising space taken for treating BOD but also of facilitating the formation of easily seperable sludge. 17.8.77 as 097834 (4pp117)

NIAB- ★ D15 30454B/16 ★J5 4031-969

Recovering dye from dyeing waste water - by aerating water, filtering to separate insolubilised dye contg. conc. liquor, and treating liquor with caustic hydrosulphite to reduce dye

NIPPON ABCO KK 16.08.77-JA-097532

F06 (09.03.79) C02c-05 D06b-23/20

A method for recovering dye, partic. vat dye, present in dyeing waste water, in which waste water contg. vat dye is oxidised by air to insolublise the vat dye, the oxidised waste water is supplied to a super filter membrane under 1-5 kg/cm^2 gauge pressure to separate it into insolublised vat dye-contg. conc. liquor and permeated liquor, the conc. liquor is treated with a caustic soda-alkaline hydrosulphite to reduce the dye present into leuco dye which is in turn recycled to the dyeing bath, and the permeated liquor is recycled to the dyed prod. washing process.

The process has high efficiency. The super filter membrane used is combined with an ultrafiltration appts. The method is applicable to all types of vat dye-contg. waste water. 16.8.77 as 097532 (5pp117)

MITQ ★ D15 30501B/16 ★J5 4032-170

Sludge treatment device - for difficulty filterable sludge

MITSUBISHI ELECTRIC CORP 17.08.77-JA-098908

Q75 (09.03.79) B01d-43 B01j-01 C02c-03 F25d-31

A device is claimed for treating sludge difficult to filter. It comprises an inner pipe for passing the sludge and an outer pipe having a freezer chamber at the inlet end and heater chamber at the opposite outlet. The inner pipe is inserted into the outer pipe leaving a space between them. The object is to reduce the operation cost and improve the working efficiency.

The vol. of a coolant reservoir tank interposed between the freezer chamber and its freezer is made slightly larger than that of the chamber. A heat accumulating medium reservoir is disposed near the coolant tank so to be capable of heat exchange with it. The heat accumulating medium may be the same material as the coolant. 17.8.77 as 098908 (3pp26)

DAIK ★ D15 30503B/16 ★J5 4032-172

Collecting water from the air - by using a condenser through which e.g. a liquefied gas flows

DAIKIN KOGYO KK 17.08.77-JA-097814

J01 (09.03.79) B01d-05

A cooling unit is connected to a condenser having a condensing face. The air around the condenser is cooled, while the condenser is cooled by the cooling unit, until the water contained in the air is condensed, and it is recovered.

A circulating coil pipe is suitably disposed around a condenser/collector consisting of steel pipes or plates to cool it by a liquefied gas flowing in the pipe, thus forming dew drops over the collector.

Prod. may be used for drinking purposes or in industry. Arrangement is low cost. 17.8.77 as 097814 (4pp26)

EBAI ★ D15 30509B/16 ★J5 4032-179

Operation control of water prodn. device - in which operation pressure of ultrafiltration and microporous membrane depends on water level variation in tank

EBARA INFILCO KK 15.08.77-JA-097585

(09.03.79) B01d-13

Water contg. salts passes through an ultrafiltrating membrane or microporous membrane device under an elevated pressure, and a filtrate water is reserved in a tank and fed into a reverse osmosis device and/or electrodialyser for desalting the water. The operation pressure of the ultrafiltrating membrane device or microporous membrane device, depending on the water level variation in the reservoir tank. If it exceeds an allowable pressure, then the membrane of this device is washed.

A large amt. of water is economically produced. 15.8.77 as 097585 (5pp26)

FJIE ★ D15 30521B/16 ★J5 4032-192

Ozoniser for desulphurising exhaust gas, waste water treatment etc. - where inner wall of high voltage electrode is coated with insulator e.g. resin to increase cooling efficiency

FUJI ELECTRIC MFG KK 17.08.77-JA-098457

A85 E36 J03 (09.03.79) C01b-13/11

The device comprises a ground electrode and a high voltage electrode having a cylindrical outer cover made of a dielectric material. The inside of the latter electrode is water-cooled. The former electrode is inserted into the latter with leaving a discharge gap between them, into which a gas contg. oxygen or pure oxygen is fed to produce ozone.

The novelty is that the inner wall of the high voltage electrode is coated with an insulator such as resin. Both electrodes are connected to separate cooling systems through joints.

The cooling efficiency of the device is increased withou increase in size. 17.8.77 as 098457 (3pp26)

ASAD ★ D15 30524B/16 ★J5 4032-19

Chlorine-contg. basic aluminium sulphate prodn. - from chlorine contg. aluminium salt soln. and water insoluble aluminiu hydroxide

ASADA KAGAKU KOGYO 15.08.77-JA-097956

E33 (09.03.79) C01f-07/74

Method comprises the reaction between (i) water-insol. aluminium hydroxide (II) of the formula, $Al_2(OH)$ 5.99 - 5.5 (Cl) 0.5 - 0.01, which is obtd. by the reaction between aluminium chloride (III) and alkali metal aluminate (IV), an (ii) aq. soln. of aluminium salt (V) contg. aluminium sulphate, at $<$80°C under atmospheric pressure in the condi ion that the basicity of the Al sulphate (I) produced becomes $\leqslant$50%. (V) should contain 0.1-30 wt.% of chlorine pe Al_2O_3.

(I) is used as coagulant and esp. effective for coagulation of iron-contg. water. (I) can be stored during 6-12 m nths without formation of ppte. 15.8.77 as 097956 (4pp42

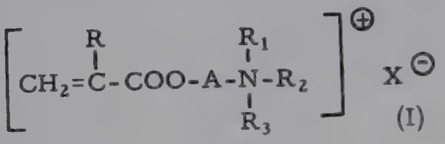
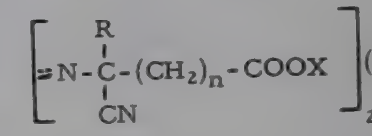
Prepn. of high mol. wt. cationic polymer, wherein acrylate or methacrylate of formula (I) is polymerised in the presence of water-soluble azo cpd. of formula (II) and a redox series of polymerisation initiator at pH 6-8.



$$\left[CH_2=\overset{R}{\overset{|}{C}}-COO-A-\underset{R_3}{\underset{|}{\overset{R_1}{\overset{|}{N}}}}-R_2\right]^{\oplus} X^{\ominus}$$

(I)



$$\left[=N-\underset{CN}{\underset{|}{\overset{R}{\overset{|}{C}}}}-(CH_2)_n-COOX\right]_2$$

(II)

In (I), R=H or methyl; R_1=H or 1-4C alkyl; R_2 and R_3=1-4C alkyl; A=2-4C straight or branched chain aliphatic gp.; and $X^{\ominus}$ = negative gp. (possible to produce a salt with ammonium nitrogen).

In (II) R=H or 1-4C alkyl; n=1-4; X=H, alkali metal, alkali earth metal, ammonium or 1-10C organic amine salt.

The polymer is used as a dye assist agent, fibre-modifying agent, filtering property-improving agent, paper sizing agent, cationic flocculating agent, etc. (I) is e.g. acryloyloxyethyl dimethylamine hydrochloride, methacryloyloxyethyl dimethylamine sulphate, acryloyloxyethyl trimethylammonium chloride, etc. (II) is e.g., 3,3'-azobis-3-cyanopropionic acid, 4,4'-azobis-4-cyanovaleric acid 5,5'-azobis-5-cyanocaproic acid, and their alkali metal salts etc. The polymerisation is pref. carried out at 15-30°C. 11.12.75 as 146855 C08f-20/34; 2/10; 4/40 (24.3.79) TOA GOSEI CHEM. Azine derivs - as reagents for determining residual chlorine in drinking and pool waters

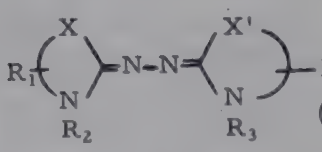
WAKO PURE CHEM IND KK 20.11.73-JA-130565

*E36 J04 R16 (E13) (26.03.79) *J50081-595 +G01n-31/22*

An arom. heterocyclic azine (I) (where R_1=SO_3H; R_2, R_3= alkyl; X and X_1=gps. forming heterocyclic cpds) is a reagent for determining residual Cl in water. The reagent is used for simple determination of residual Cl in drinking water and pool water.



(I)

Thus, 2,2'-azinobis(3-ethylbenzothiazolone-6-sulphonic acid) 6g and tartaric acid 60g were dissolved in distilled water. A test water (12ml) was added to a test tube contg. 0.5ml of an aq. soln. of (II). The absorbance was measured at 415 mμ in <1 min. to determine residual Cl. The total Cl was determined by iodometric titration. For a test water, the determined total residual Cl 0.17, free Cl 0.01 and combined Cl 0.16ppm. 20.11.73. as 130565 G01n-31/32 (26.3.79) WAKO PURE CHEM. IND. KK (5pp) (J5 0081595)

Ultrasonic sensor for active slime level in effluent - uses resonant signal shaper, pulse generator, amplifier and relay unit
WATER SUPPLY HYDROGEOL 17.05.76-SU-362324
R13 (18.05.78) G01f-23/28

Ultrasonic sensor for monitoring the level of active slime in effluent waters comprises pulse generator coupled to resonant signal shaper and piezoelement connected to amplifier and to relays.

In order to increase resolution and interference rejection and to reduce sensitivity threshold, the system is provided with resonant signal shaper whose multiple coeff. of the peak low frequency component to the frequency of the ultrasonic signal is of the order of 0.001. The pulse generator is coupled to pulse shaper whose output is joined to the ultrasonic transsensor.

Measurements of suspended solids in flowing liq. - using light source with square of received signal as measured parameter

SVENSKA TRAFORSKNIN 01.12.75-SW-013524
*F09 J04 R16 (29.08.78) *DT2654-155 G01n-21/26 +G01n-33/46*

The percentage of suspended substances in a flowing medium is indicated by illuminating the medium with light perpendicular to the flow and measuring the light radiated from the medium.

The radiated light is detected in a predetermined direction by a light detector producing a signal, the effective value of that portion of the signal which is within a predetermined frequency range being squared to give the required percentage. The result is accurate and independent of particle size variation. Measurement of suspended fibres in waste water in the forestry industry is referred to. 23. 11. 76 as 744362 (10pp1379)

KIRS/ ★ D15 31382B/16 ★US 4110-170

Domestic water distillation - with condenser and thermostat admitting water to boiler in response to distilled water temp.

KIRSCHMAN F C 28.04.76-US-681051
(29.08.78) B01d-03/42

A domestic water still comprises a boiler with a tubed condenser mounted directly above it. Feed water is fed to a reservoir which surrounds the condenser tube to preheat the water prior to transfer to the boiler via a wier. A valve senses the temp. of distilled water discharged from the condenser tube and controls the addn. of further water to the condenser reservoir.

Pref. the temp. sensitive valve adjusts the flow of feed water to maintain a distilled water temp. of 190-210°F. The boiler includes a drain which removes non-volatile components from the feed water.

The appts. distills water for domestic use. 28. 4. 76 as 681051 (7pp295)

Pond for collecting solar energy - comprises insulated reservoir with water and air inlets and outlets below blackened plate

UOP INC 28.03.77-US-782147 (31.01.77-US-764255)
(29.08.78) B01d-01/14

Solar energy collecting panel comprises a reservoir for water with a bottom and vertical sidewalls. The sidewalls are provided with air and water inlets and outlets, the air conduits being above the water conduits.

A horizontal plate with a black coating extends over the reservoir above the conduits. The plate is supported by spaced-apart vertical standards resting on the reservoir bottom. A transparent cover over the reservoir provides a dead air space above the plate. The reservoir bottom and sidewalls include insulation.

Used for the recovery of potable water from river or sea. 28. 3. 77 as 782147 (+31. 1. 77-US-764256) (6pp1050)

UNVO ★ D15 31385B/16 ★US 4110-174

Desalinating sea water in multistage flash evaporator - with solar pond heating and power generation via turbine

UOP INC 16.12.76-US-751424
(29.08.78) B01d-03/06

An appts. for desalinating water comprises preheating a first sea water stream and further increasing its temp. in a solar pond. The heated sea water is fed to a series of 4-10 vacuum flash evaporators. Vapour from the first stage drives a turbine to generate power while vapour from the remaining stages is condensed by indirectly contacting the first sea water stream to yield potable water.

Vapour from the turbine is condensed by indirect contact with a second stream of the sea water colder than the first and used also to condense vapour from the final stage of the appts. Preferably the final stage is operated [illegible] Pref. a temp. difference of 15°F exists between the two streams.

The appts. generates power and potable water. 16. 12. 76 as 751424 (10pp295)

first and used also to condense vapour from the final stage of the appts. Preferably the final stage is operated Pref. a temp. difference of 15°F ex-

alkyl.

The compsn. is free of hydrocarbon solvent, chemic stable over a wide temp. range, and is readily diluted water esp. sea water, without risk of gellation. 8.11.76 as 739993 (7pp945)

SUNO ★ D15 31403B/16 ★US 4110-215
Liq. level control in sepn. tank - by selectively opening weir by pneumatic system controlled by liq. level
SUN OIL CO PENNSYLV 22.03.76-US-668871
H05 (29.08.78) B01d-33/38

Sepn. tank separates scum and settled sludge from polluted water while allowing pollutant-free water to be discharged. This discharge is via a weir box which includes a pneumatically controlled gate which alters the liq. level in the settling tank.

A stilling well located on the sidewall of the sepg. tank is connected to a pneumatic sensor which detects the liq. level in the tank. A pneumatic control circuit connects this sensor to the weir control to maintain a predetermined liq. level in the tank.

Appts. dynamically controls the liq. level in the sepn. tank despite rapid variations in the influent flow rate. 22.3.76 as 668871 (7pp 295)

NAKA/ ★ D15 31405B/16 ★US 4110-217
Continuous sewage sludge heat treatment appts. - has porous plate to divide sludge into thin strings
NAKAMURA G 11.04.77-US-786467
Q76 (29.08.78) F26b-17/12

Sludge from the final settling tank of a sewage disposal system is delivered to a vertical cylindrical vessel which has a conical head. The sludge is introduced through an upper inlet and is removed through a lower discharge. Steam is fed from a surrounding jacket through pores in the side wall of the vessel.

A porous plate is positioned across the vessel just below the conical section so that the sludge is divided into thin strings prior to treatment with the steam. The steam is at a relatively low pressure and temp.

Appts. is used to continuously treat sludge from the final settling tank of a sewage disposal system on a large industrial scale. The sludge is treated with steam at a relatively low pressure and temp. without requiring a long period of aging. 11.4.77 as 786467 (5pp295)

MAPL/ ★ D15 31407B/16 ★US 4110-219
Reverse osmosis water purifier - with osmosis modules in recess of support base for connected water container
MAPLES P D 02.02.77-US-764828
J01 (29.08.78) B01d-31 C02b-01/82

A purifier comprises a portable water container on a base container on a base with a recess holding a reverse osmosis unit laid lengthwise and connected by a tube with the container. A removable stopper end connector links the unit with the tube and has a seal to prevent leakage.

The overall length of unit and connector is slightly less than the distance between base end walls so that outward sliding of the connector is prevented. The unit pref. has at least a pair of modules connected in parallel and the connector has a cylindrical plug slidably insertable into the unit bore. 2.2.77 as 764828 (6pp1358)

SNAM ★ D16 29762B/16 ★BE -871-253
Radial flow catalytic enzyme reactor for isomerisation of fructose - uses catalytic bed of helically wound fibres contg. immobilised enzyme
SNAMPROGETTI SPA 13.10.77-IT-028553
J04 (13.04.79) B01j C12b

A radial flow reactor is claimed for carrying out catalytic reactions with the assistance of enzymes The reactor comprises a hollow, cylindrical casing with removable end cover. The casing contains a coaxial, annular, catalytic bed comprising fibres in which the enzymes are locked. The fibres are helically wound on a porous core tube. The pitch of the winding is determined to provide optimum hydraulic and chemical characteristics, and is pref. between 0.001mm and 10 cm.

The casing is designed to direct flow of liq. radially through the winding. The casing inlet has a by-pass branch outlet. The catalytic bed can be made up of several, helically wound cartridges which may be wound at different pitches to provide a bed compsn. of varying characteristics over its length.

Used partic. for the isomerisation of fructose with a glucose-isomerase enzyme. Also for the conversion of sucrose or lactose into fructose and glucose. Very low pressure drop through the reactor produces a much higher output. The catalytic bed can be easily made up to offer a wide variety of characteristics which are readily reproducible. 13.10.78 as 871253 (13pp448)

Biological fermentation appts - for heterotrophic microorganism and algae
KRUPP F GMBH 04.06.71-DT-127747
*(12.04.79) *DT2127-747 C12b-01/10*

Heterotropic microorganisms and algae, e.g. for the pharmaceutical, fermentation and food industries, are produced in a fermenter which is easily built. The fermenter has fitted above it an ejector entrance through which the fermentation medium is passed and where it is mixed with air by suction. Immediately after the ejector inlet there is a mixing chamber where nutrient soln. and salts are added and then there is a pipe to return the mixt. to the fermenter. 4.6.71 as 127747 (4pp068).

MOCH= D16 44497U/32 =DS 2300-088
Continuous sparkling wine prodn - from still wine
MOSC CHAMPAGNE WKS (MOS -) 04.01.72-SU-737547
*(12.04.79) *DT2300-088 C12g-01/06 +C12l-11*

In the continuous preparation of sparkling wine, the fermentation mixture undergoes, after the first fermentation, a secondary fermentation at a gradually dropping temp. and a constant pressure with several changes in the direction of flow. The fermentation takes place at a stable average linear flow velocity and the mixture is cooled by passing it from the centre of a tank in concentric rings up and down to the outside. External cooling is applied only in the last outermost section.

This simplifies the design of the vat, saves space and produces a high-quality sparkling wine. 2.1.73 as 300088 (4pp39).

BRAS- D16 43091U/31 =DS 2300-786
Brewery vat - with multistorey heating or cooling system for single vat process
BRASSERIES KRONENBO (BRA -) 11.01.72-FR-001637
*+Q34 (12.04.79) *DT2300-786 C12b-01/10*

A fermenting vat for beer breweries is a cylindrical tank with a domed top and a conical bottom. A central tube along the axis of the vat has radial branches of short, alternating with longer pipes for a cleaning fluid. The central tube also houses a system of pipes which extend radially in short, alternating with longer branches, for the sampling of beer for analysis. The longer branches are supported by struts and all branches end in spray heads.

This simplifies the supervision of the fermentation process and the vat cleaning even when they are of exceptional size (10 m dia. and 20 m height). 8.1.73 as 300786 (11pp39).

FARH D16 26055W/16 =DS 2348-753
Protein of high amino acid content - produced by fermentation in a broth of specified n-paraffin concn.
HOECHST AG 28.09.73-DT-348753
*H04 (12.04.79) *DT2348-753 C12c-11/08*

Yeast is fermented under aerobic conditions at pH 2.0-6.8 in a medium contg. a nitrogen source and an 8-23C n-paraffin as carbon source. The yeast is Candida lipolytica, Candida viswanathii, Candida parapsilosis or Candida guillermondi. The medium contains 0.04-0.12 wt.% n-paraffin, based on the culture suspension, during the phase of logarithmic growth.

The yeast prepd. may be used as a protein source in food or animal feeds. 28.9.73 as 348753 (4pp068).

BEHW D16 27155A/15 =DS 2644-622
Microorganism extn. with aq. guanidine salt soln. - esp. for preparing Staphylococcus extract suspensions used as diagnostic reagents (NL 4.4.78)
BEHRINGWERKE AG 02.10.76-DT-644622
*+R16 (12.04.79) *DT2644-622 C12k-01*

Microorganisms with a positive clumping factor or contg. a peptide binding the F_c-part are treated with a 4-8 molar aq. soln. of a guanidine salt, washed free of this and recovered.

The microorganisms are pref. dyed with basic red 23 and used to determine antigens. Pref. microorganism is Staphylococcus aureus ATCC 31243 or NCTT 8530. 2.10.76 as 644622 (4pp068).

KURE D16 26299Y/15 #DS 2708-112
Microbial food prepd. by culturing Methylomonas probus - in medium contg. methanol as carbon source
KUREHA KAGAKU KOGYO 29.08.75-JA-104093 (25.02.77-DT-708112)
*(D13) (12.04.79) *J52028-988 C12d-13/06*

Protein is prepd. by fermentation of Methylomonas probus FERM-P No. 3193 under aerobic conditions in a medium contg. methanol as carbon source, nitrogen and inorganic nutrients and recovering the bacterial cells formed.

The protein may be used for food and in animal feeds. 25.2.77 as 708112 (7pp068).

FARB D16 84216A/47 =DS 2719-912
Amino-sugar saccharase inhibitor isolation - from actinoplanaceae cultures by ion exchange adsorption
BAYER AG 04.05.77-DT-719912
*A91 B03 (12.04.79) *DT2719-912 C07h-15/20*

Isolation of O- 4,6-dideoxy-4-[1S(1,4,6/5)-4,5,6-trihydroxy-3-hydroxymethylcyclohex-2-ene-1-yl]amino -α-D-glucopyranosyl-1,4-O-α-D-glucopyranosyl-1,4-D-glucopyranose from culture media in which Actinoplanes species have been propagated comprises treatment with a strongly acidic cation exchange resin, (H^+ form), having little crosslinking, and an anion exchange resin (OH^- form); the resin is sepd., washed and eluted with dilute aq. salt or NH_3 soln; the eluate is then passed through a highly crosslinked strongly acidic cation exchange resin (H^+ form) followed by an anion exchange resin (OH^- form); the eluate is then passed through strongly acidic cation exchange resin (H^+ form) having little crosslinking; the resin is washed and eluted with aq. mineral acid of pH 1-2; the pH of the active fraction is raised to 5-7, and the soln. is concentrated; the prod. is filtered and dried.

Polystyrene resins with 2-6% and 7-20% crosslinking are prefd. Prefd. salts solns. for elution comprise alkali, alkaline earth and/or NH_4 salts or weak acids, esp. NaOAc. The prod. is an esp. active saccharose inhibitor. 4.5.77 as 719912.

STEI ★ D16 29914B/16 ★DT 2744-854
Cleaning system for tanks and vessels - using spray cleaner with strainer vessel on liquor return line having automatic cleaning cycle
STEINECKER A MASCH GMBH 05.10.77-DT-744854
J02 P43 (12.04.79) B01d-35 B08b-03

Cleaning system has series of wash liquor vessels, the contacts of which are pumped to the rotating spray head. The return liquor from the vessel being cleaned passes through a strainer to remove and collect dirt.

This consists of a cylindrical vessel containing a cylindrical screen which divides it into two chambers. The run off from the vessel being cleaned runs into the centre of this and a discharge to drain leaves from this. The liquor flows to the storage vessels after passing through the screen. Opening the drain valve allows dirt collected on the screen to be regularly discharged.

For use in industries where vessel cleaning is needed e.g. in breweries. Conventional filters require dismantling for cleaning. The system described allows an automatic cycle to be followed. 5.10.77 as 744854 (14pp1053)

KRAT ★ D16 29917B/16 ★DT 2744-950
Grape processing system - has vacuum in berry stripper and juice weighing machine to prevent oxidn.
BIZERBA-WERKE KRAUT KG 06.10.77-DT-744950
(12.04.79) C12g-01/02

Grapes are processed by stripping the berries, weighing the grape juice produced and pumping it into a storage tank. During all these operations, a vacuum is maintained in the stripper, weigher and interconnections.

Oxidn. of the grapes is prevented without the necessity of adding any chemical substances. 6.10.77 as 744950 (18 pp39)

BRIK- ★ D16 29946B/16 ★DT 2745-541
Purifying sulphydryl oxidase enzyme derived from whole milk - esp. prior to immobilising on glass beads; used to remove boiled taste of heated milk
BRIK PAK INC 10.10.77-DT-745541
B04 (D13) (12.04.79) A23c-09 C07g-07/02

Process comprises (a) preparing a crude, non-purified sulphydryl oxidase enzyme (I)-fraction from raw whole milk; (b) dissolving this non-purified (I)-fraction in a dil. neutral buffer soln; (c) equalising the non-purified (I)-fraction; (d) exposing the non-purified (I)-fraction in buffer soln. to a separate treatment, to separate a first (I)-fraction of molecularly larger materials; (e) concentrating the first enzyme fraction, esp. by ultra-filtration, to obtain a 2nd enzyme-fraction and (f) sepg. this 2nd enzyme fraction, pref. by centrifuging, to remove molecularly smaller materials and isolate (I).

The isolated enzyme is esp. dissolved in a neutral buffer soln., to obtain a 3rd enzyme fraction; the enzyme is sepd. from molecularly smaller materials; isolated to obtain an enzyme having higher specified activity, and pref. immobilised on glass beads.

The purified, immobilised (I) is used (i) to remove the boiled taste from milk heat-treated above 68°C, and (ii) in biosynthesis of disulphides in certain proteins. Sterilised treated milk can be obtd. which is marketable and resists storage at ambient temps. The specific activity of purified, immobilised (I) is $\geqslant 50$ (> 100) x higher than that of the crude (I)-fraction obtd. from the whey fraction sepd. from raw whole milk-derived skim milk. 10.10.77 as 745541 (34pp200)

TOXN ★ D16 30022B/16 ★DT 2842-940
Fermentative prodn. of sarcosine oxidase - using microorganism of genus Bacillus, for creatinine determn. in blood or urine etc. (NL 6.4.79)
TOYO BREWING KK 04.10.77-JA-119776
B04 R16 (12.04.79) C12d-13/10 C12k-03 G01n-31/14 G01n-33/16

Prodn. of sarcosine oxidase (SO) is carried out by culturing an SO-producing microorganism of the genus Bacillus, esp. the new species B-0618 (FERM-P 4049), in a nutrient medium and isolating the SO from the culture mass. Culture is pref. effected at 26-33°C under submerse aerobic conditions in a medium contg. N and C sources and minerals. Addn. of 0.5-1% creatine to the medium stimulates SO prodn.

SO catalyses the conversion of sarcosine to glycine, HCHO and H_2O_2. It can be used for the determn. of creatinine in blood or urine (in combination with creatinase and creatinase) or for determining the activity of creatininase. 2.10.78 as 842940 (20pp367)

KIKK ★ D16 30037B/16 ★DT 2843-351
Pectin esterase having methyl ester hydrolysing activity - prepd. by cultivating mould fungi; used for de:methoxylating pectin
KIKKOMAN SHOYU KK 12.10.77-JA-121398 (08.10.77-JA-120504)
(12.04.79) C12d-13

New pectin esterase (I), is prepd. by (1) cultivating a mould fungus of Aspergillus, Penicillium, Fusarium or Sclerotinia species, in a liq. or solid medium contg. C- and N-sources and inorganic salts, pref. for 1-5 days at 20-40°C, and separating (I) from culture.

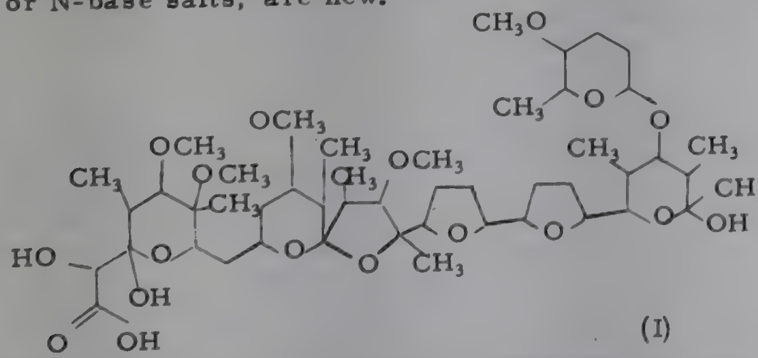
(I) has specified characteristics properties including (a) activity on Me ester bond of pectin, under statistical hydrolysis of the Me ester bond; selectivity towards pectin Me ester bond and no activity towards Et-, propyl- and ethylene glycol ester bonds; (b) optimum reactivity at pH 4.5 and stability at pH 3-6; and (c) activity at 25-50 (40-45)°C. (I) is an acid protein having isoelectric point PI 4.1.

(I) is used in enzymatic demethoxylation of pectin, to produce a demethoxylated pectin having a uniform MeO gp. content. The low methoxy-pectin can be used as gelling agent and film-former for yogurt and mayonnaise.

Pectin gel strength increases with decreasing MeO content, e.g. on reducing MeO gp. content from 10.5- to 6.3% gel strength increased from 2.45- to 21.20 x 10^4 dyne/cm^2 after adding 26 mg/g $CaCl_2$. 4.10.78 as 843351 (39pp200)

RHON ★ D16 30048B/16 ★DT 2843-702
Antibiotic 37454 RP for control of coccidiosis - prepd. by cultivation of Streptomyces gypseus
RHONE-POULENC INDUSTRIES 07.10.77-FR-030236
B03 C02 (12.04.79) A23k-01/17 A61k-31/33 C07d-493/10 C12d-09/16 C12k-03

Antibiotic of formula (I), designated 37454 RP, and its metal or N-base salts, are new.



(I)

The Na salt is a white crystalline powder sol. in chlorinated solvents, alcohols, DMF, acetone and ethyl acetate, slightly sol. in hexane and practically insol. in water. It has analyses 59.27% C; 8.45% H; 28.32% O and 2.36% Na ($C_{48}H_{81}O_{18}Na$); m. pt. 198-199.5°C and $[\alpha]^{20} = +2.3 \pm 0.5°$ and $[\alpha]^{20}_{436} = +1.3 \pm 0.6°$ (c=0.974% in methanol). It has characteristic IR and NMR spectra (given) but no characteristic UV absorption.

(I) has anticoccidiosis activity and is effective when incorporated in poultry feed at 0.005-0.04 wt. %. It also mice is 90 mg/kg (single dose). 6.10.78 as 843702 (33pp1251)

DAII- ★ D16 30061B/16 ★DT 2844-311
Agglutinant prepd. by Dematium fungus cultivation - used for flocculating (in)organic suspensions, colloids, proteins and germs from water
DAI-ICHI TOGYO 17.08.78-JA-100150 (11.10.77-JA-121687)
(D15) (12.04.79) C02b-01/20 C02c-05/02 C07g-07 C12d-13 C12k-01

Microorganism used in prepn. of an agglutinant, (A), by bacterial fermentation, is an (A)-forming Dematium fungus, of Dematiaceae species. Pref. culture medium contains 0.5-5% C source, and partic. carbohydrate as main C source. (A) has an agglutinating activity on organic and inorganic substances, minerals and living germs, present or floating as a suspension, dispersion or colloid in liqs.

(A) or an (A)-contg. prod. obtd. by cultivating an (A)-forming Dematium fungus, is used for flocculating inorganic or organic, insoluble suspensoids and colloids, and insoluble and soluble proteins, from water or industrial waste waters, partic. from crude water for drinking water prepn., and from waste waters of animal husbandry, food-, chemical- or paper- and other industries.

Max yield of (A) is obtd. in a medium having a low C source concn., e.g. 1%. Waste waters from agricultural plant, animal farms and food factories can be used as culture media for Dematium fungus. (A) have high agglutinating capacity, e.g. inorganic ions can be removed quantitatively. 11.10.78 as 844311 (+10.8.78-JA-097664) (55pp200)

MARI/ ★ D16 30092B/16 ★FR 2397-457
Detection of bacteria in samples - using appts. measuring small changes in pH caused by bacterial growth
MARIEL C 15.07.77-GB-029864
B04 P31 R16 (16.03.79) A61b-10 C12k-01/04 G01n-27/26 G01n-33/16

Appts. for the rapid detection of the presence of bacteria and also for determining the sensitivity of bacteria to various antibiotics comprises (a) a series of flasks into which culture media and blood samples are introduced aseptically each flash having a sterilisable electrode, (b) an electronic switch, to which each electrode is attached, (c) a pH meter attached to the switch, and (d) a potentiometric recorder and a mini-ordinator which follows a program and is connected to a keyboard and controls an alarm system.

Any bacterial growth in the flasks causes a change in pH in the medium, and this is detected and analysed to ensure that the change is significant; usually a change of 0.04 pH unit is significant.

Appts. does not give rise to contamination problems, nor involve the use of radioactive isotopes, unlike known diagnostic methods. 29.6.68 as 019530 (12pp520)

Prepn. of fraction useful e.g. as antidiabetic - by fractionating active material accelerating insulin secretion produced by Bordetella strain
KAKENYAKKA KAKO KK 17.08.77-JA-098821
B04 (10.03.79) A61k-35/74

Prodn. of biologically active fractions activity = acceleration of insulin secretion, enhancement of immunity, and activity blocking the β-receptor of sympathetic nerve) comprises fractionating an active material accelerating insulin secretion produced by a strain of Bordetella (e.g. Bordetella pertussis, B. parapertussis, B. bronchiseptica) into 2-5 fractions. These fractions are aggregated each other to give a giologically active aggregate.

Fractions or aggregate can be used as anti-diabetics, immune controlling agents or β-receptor blocker. The active material produced by Bordetella has adverse reactions such as increase of number of leukocytes, enhancement of sensitivity to histamine and antigenicity. By fractionation or aggregation of the fractions of the active material, such adverse reactions can be reduced markedly without decrease of the insulin secretion acceleration. 17.8.77 as 098821 (47pp52)

Bacterial body prepn. - by culturing bacteria of Pseudomonas be
in culture medium contg. water soluble carbon source
TOYO SODA KK 10.08.77-JA-094928
(10.03.79) A23k-01 A23l-01/34 C12k-03

The method comprises culturing the bacteria of Pseudomonas bells in the culture medium contg. water soluble C source and recovering bacterial body from the culture medium. The bacterial strain can grow at relatively high temp. of ca. 40°C and the bacterial body can be produced effectively.

The applicable bacterial strain is P. bella TS-1008 (FERM-P 4074). As water soluble C source mono-hydric alcohol poly-hydric alcohol etc.), sugar, fatty acid, etc. can be used. 10.8.77 as 094928 (6pp5)

TAKE/ ★ D16 30711B/16 ★J5 4032-690

Culturing photosynthesisable fine algae - by extn. of green juice from vegetable leaves, culturing, forming callus cells, decolouring, re colouring, etc.

TAKESHITA S 19.08.77-JA-098708
P14 (10.03.79) A01k-61 C12k-01 C12k-09

The method consists of following four processes. Green leaves of vegetables are pulverised using juicer or mixer to obtain green juice and the green juice is roughly filtered with a strainer to remove large solid particles. The green juice is mixed with synthetic culture medium and the mixt. is cultured under natural light. The green cells are dedifferentiated with wound hormone to callus cells and the pigments such as chlorophyll, carotine, xanthophyll, etc. are decomposed to become colourless.

When the culture is continued, callus cells are redifferentiated and colourless bodies are converted to chlorophyll, carotinoid, pigment, etc. in ca. 10 days. Callus cells are disappeared and small green cells are multiplied, i.e. the callus cells are restored through the atavism to autotrophic monocellular photo-synthetising algae and the algae can multiply through fission.

The induced algae can be multiplied vigorously either in inorganic medium or in organic medium continuously. 19.8.77 as 098708 (4pp5)

YAGI/ ★ D16 30713B/16 ★J5 4032-692

Fixed apo-enzyme of D-aminoacid oxidase prepn. - by reacting its competitive inhibitor complex with activated polysaccharide, expelling the inhibitor and dialysing

YAGI K 12.08.77-JA-096231
B04 (10.03.79) C07g-07/02

The method comprises (1) reacting the stable complex composed of D-aminoacid oxidase and its competitive inhibitor, with activated polysaccharide to fix the complex (2) expelling the inhibitor with the substrate to obtain fixed holo-enzyme and (3) dialysing it in aqs. KBr solution to obtain fixed apo-enzyme.

The fixed apo-enzyme of D-aminoacid oxidase is stabler than free apo-enzyme and the activity of the apo-enzyme obtained from the fixed holo-enzyme is much stronger than that of the apo-enzyme obtained by fixing apo-enzyme on activated polysaccharide. Thus prepared fixed apo-enzyme of D-aminoacid oxidase can be used for determining flavin-adenine-dinucleotide (FAD), which is the coenzyme of D-aminoacid oxidase. It can be preserved for 20 days with a decrease in activity of < 20%. 12.8.77 as 096231 (3pp5)

Prodn. of an immunogenically active attenuated live equine rhinopneumonitis (ERP) virus comprises (a) introducing a live virulent equine rhinopneumonitis virus into a Vero cell culture, (b) incubating the culture until the cellular cytopathology becomes evident, (c) harvesting a portion of the virus so produced and reintroducing the harvested virus into fresh tissue cultures, (d) repeating serial passage of the virus in tissue culture at 22-33°C to produce a live avirulent virus and (e) recovering the virus.

Pref. incubation temp. of each passage is 26°C and serial passage is carried out $\geqslant$ 30 ($\geqslant$ 50) times. Vaccines obtd. from the virus give none of the usual ERP symptoms in horses, inoculated intramuscularly (no nasal or ocular discharge, no fever, no anorexia, etc.). Vaccination of a mare prior to breeding and during pregnancy prevents abortions caused by virulent ERP virus. 23.4.76 as 679840 (13pp992)

Prods. based on new alpha-glucane - derived from sugars by action of microorganisms of Elsinoe strain
HAYASHIBARA SEIBUTS 30.09.77-JA-117667
A11 F01 (D16) (12.04.79) C08b-37

Prods. are composed of or contain a new α-glucane (elsinan) with recurring units of formula [3)-Glc-(1→4)-Glc-(1→4)-Glc-(1→] (in which Glc is an α-D-glucopyranose gp).

The main structure is almost linear, with three α-1,4-linked glucose gps. (i.e. maltotriose units) linked in succession through α-1,3-bonds, and also contains some maltotetrose units.

Used as granulate, fibres, yarns, films, papers, sponges, tubes, coatings, etc. in the foodstuffs, clothing, furnishing, building, agriculture and fishing industries, and as technical prods. for chemicals, cosmetics and pharmaceuticals. Elsinan is more stable than amylose and less water-sensitive than pullulan. It is sol. in hot water, transparent, non-toxic, edible and can be stored for long periods without change in properties. Films are tough, flexible, oil-resistant, impermeable to air and oxygen and have good electrical insulating properties. 2.10.78 as 842855 (32pp195)

Cigarette filters prodn. - from stable, rod-shaped elements obtd. from strand or tow of filaments or fibres
BAUMGARTNER PAPIERS 15.12.77-CH-015432
F04 P15 (30.03.79) A24c D04h

Stable, rod-shaped elements for cigarette filters are produced from filamentary or fibrous material in the form of a strand or tow which has been crimped and sized. The process comprises directing the strand or tow of loosely packed filaments of fibres to an endless transporter and shaping ribbon in a continuous feed, for shaping, wrapping and cutting. The cut rods are submitted to setting after cutting, then sub-divided by a cutter into short lengths. Appts. used provides cigarette filters which may contain inner chambers filled with e.g. active carbon.

Appts. does not submit the strand or tow to harmful stretching or compression during processing. Pref. the strand is unconstrained in any way while it is in contact with the transporter and shaper ribbon. 13.12.78 as 872712 (19pp1359)

Animal skin cleaning and curing unit - comprises container with corrugated surface reciprocating in vat with brine flow

SVERD ROCMYASOMOLRE 20.12.76-SU-429401

(10.05.78) C14c-15

The cleaning and curing of hides is improved using a simplified and cheaper flow line with pretreatment unit below the loader. It has a container with a corrugated surface reciprocating in the vat along a vertical plane, and featuring a unit inducing a flow of brine. The container is operated by a cylinder, and the brine is forced by two synchronously rotating activators mounted on oppostite walls of the container.

The preliminary treatment unit combines dung cleaning with brining and thus reduces the working time for curing. The hides loaded into the brine flow contact the corrugated surface of the container and are then subject to braking. The resulting friction between the skins promotes dung removal and accelerates diffusion of the brine.

The compsn. can also contain 0.1-10% of $MgCl_2$, as well s other marine substances. The max. level of silicate lumina is pref. 70 wt.% together with the clay, which as degreasing properties, talc and limestone powder (oyster shells).

The compsn. is a medico-thermal product, used for ealth, beauty, and toilet purposes. It has absorbent pow-

or mud applications, it pref. contains 50 wt % of the marine clay contg. oyster secretions. 13.7.77 as 021598 (4pp1331)

COLG D21 36931A/21 =GB 1544-563
Surfactant mixt. for skin-softening foam baths - contg. water-soluble, cationic nitrogen-contg. polymer, zwitterionic betaine or sulpho-betaine and nonionic organic oxide
COLGATE PALMOLIVE CO 16.11.76-US-742326
*A96 (19.04.79) *DT2750-777 C11d-01/94 +C11d-03/37*

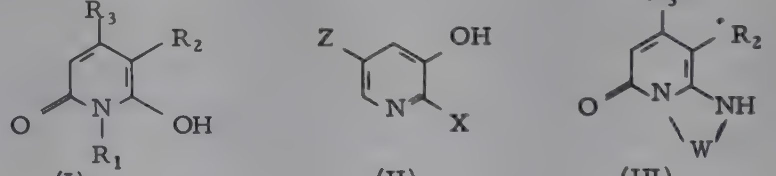
Surfactant compsn. for producing an emollient bubble bath comprises 0.5-2 pts. ⩾ 1 water-sol. cationic N-contg. polymer of mol. wt. 2,000-3,000,000 and cationic charge density > 0.001 in aq. soln. Compsn. also contains 4-7 pts. per pt. of N-contg. polymer, of ⩾ 1 zwitterionic (sulpho)betaine of formula $R-(XR')_xR^2R^2N^+-R^3-Z^-$ or $R-(XR')_x-CH(N^+R^2R^2R^2)R^3-Z^-$; and 8-15 pts. per pt. of N-contg. polymer, of ⩾ 1 polar nonionic organic oxide of formula $R-(XR')_xR^2(R^2)_yY\rightarrow O$.

In the formulae, R is 10-20C alkyl, alkenyl or hydroxyalkyl, X is -CONH- or -O-, R' is 2-3C (hydroxy)alkylene, x is 0 or 1 when X is -CONH- and 0-5 when X is -O-; R^2 are each 1-4C (hydroxy)alkyl or bonded with adjacent N as morpholinyl, piperidinyl, pyrrolidinyl or N-alkyl piperazinyl; R^3 is 1-4C (hydroxy)alkylene, Z is -COO- or $-SO_3-$, Y is N, P or S, y is 0 when Y is S and 1 when Y is N or P.

Compsn. has good emollient effect in bubble bath. 16.11.77 as 047702 (7pp931)

HENK D21 19950A/11 =GB 1544-587
Hair colouring agents giving wide range of colours - by successive application of diazonium salts and specific pyridine derivs. as coupling agent
HENKEL KG AUF AKTIEN (CIBA) 02.09.76-CH-011135
*E21 (19.04.79) *DT2739-227 D06p-03/04*

Human hair is dyed with developing dyes by applying a diazo salt and a coupling component successively but in either sequence, to the hair and coupling them. The coupling component is of formula (I), (II) or (III).

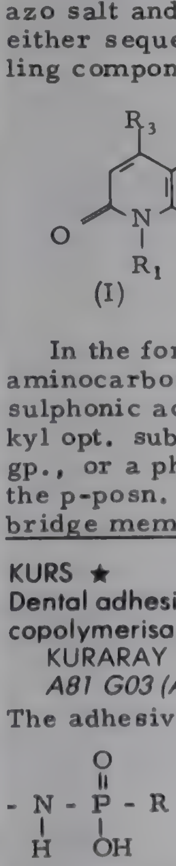


(I) (II) (III)

In the formulae, R_1 is H or an organic gp.; R_2 is CN, aminocarbonyl or alkyl substd. by carboxylic acid gp. or sulphonic acid or alkylsulphonic acid gp.; R_3 is ⩽ 5C alkyl opt. substd. by carboxylic acid gp. or sulphonic acid gp., or a phenyl gp. opt. further substd. by pyridone in the p-posn.; X is OH or NH_2; Z is H or halogen; W is a bridge member. 2.9.77 as 036798 (14pp910)

KURS ★ D21 30180B/16 ★J5 3144-939
Dental adhesive compsn. contg. organo-phosphorus gps. - and pref. copolymerisable functional gps.
KURARAY KK 24.05.77-JA-060766
A81 G03 (A14 A96) (16.12.78) C08k-05/51 C09j-03/14

The adhesives contain cpd. contg. gps. of formula (I).



$$-\underset{\substack{|\\H}}{N}-\overset{\substack{O\\ \|}}{\underset{\substack{|\\OH}}{P}}-R \quad (I)$$

(where R is R', OR' or NR'R''; R' and R'' are H or organic residues). The adhesives have appropriate hardness, compression strength and water-absorbing property and excellent adhesive power to enamel.

Pref. the cpds. contg. the gps. of formula (I) contain functional gps. copolymerisable with other monomers.

compsns. is 0.1-0.3 wt.%. The cpds. contg. gps. (I) may be added to resins or may be used as primer.

In the case where the cpds. are added to resins, the resins are mixed with inorganic materials such as quartz powder, glass powder, alumina powder, and polymethyl methacrylate, etc. to improve the property of the resins and to minimise contraction of vol. on polymerisation and curing. The cpds. contg. gps. (I) may be used in the form of cement by mixing with ZnO, MgO, etc. The OH gp. of the cpds. may partially be substd. by salts such as ONa. 24.5.77 as 060766 (4pp136)

OSOL ★ D21 30515B/16 ★J5 4032-185

Aerosol compsn. contg. water, alcohol and liquefied petroleum gas - used e.g. for application of sweat-suppressing agent

OSAKA AEROSOL KOGYO KK 16.08.77-JA-097482
G04 P34 (09.03.79) A61k-09/12 A61l-09 A61m-11/02 C09k-03/30

Water-contg. aerosol (I), which is not effervescent and can be injected is prepd. using mixt. of 30-80 wt.% of water and 20-70 wt.% of 1-6 C alcohol (II), and adding 10-30 w/v % of liquefied petroleum gas, that has vapour pressure of 0.8-8.0 kg/cm² at 20°C.

(I) is flame resistant and can be sprayed in fine mist and dried easily. (I) is prepd. inexpensively and can dissolve a number of cpds. Toxic gas and solvent contg. chlorine are not used in (I). Examples of (II) are (m)ethanol, (iso)propanol, butanol and glycerol.

In an example, (I) for sweat suppressive spray was prepd. by mixing 0.3 wt.% of sweat-suppressive agent, 5.7 wt.% of talc, 46.0 wt.% of distilled water, 22.7 wt.% of ethanol denatured by geraniol, 0.3 wt.% of surfactant, 22.0 wt.% of dimethyl ether and 3.0 wt.% of liquefied petroleum gas. 16.8.77 as 097482 (4pp42)

(10.03.79) A61k-07/50

A bath mixt. is prepd. by granulating with water a carrier consisting of starch and/or corn powder opt. with a swelling agent and/or a binding agent, drying the granules by irradiation of IR rays of 3-55μ, and impregnating the dried granules with a bath perfume. The bath perfumes are selected from jasmine oil, rose oil, lavender oil, lime oil, limonene, linalool, geraniol, citronellol, etc. 18.8.77 ad 098259 (5pp16)

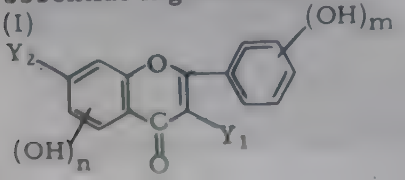
ASAE ★ D21 30696B/16 ★J5 4032-638

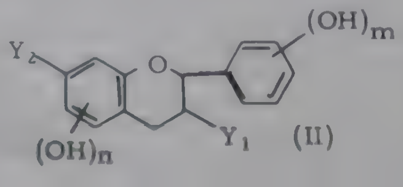
Cosmetic base compsn. - contg. alkylene oxide polymer and benzopyran deriv(s).

ASAHI ELECTROCHEM IND KK 17.08.77-JA-098520
A96 E13 P34 (A25) (10.03.79) A61k-07 A61l-09/ C08l-101*

The cosmetic base compsn. contains ≥1 of the cpds. of formula (I) and (II) and an alkyleneoxide polymer as the essential ingredients.

(I)





(II)

In the formulae, Y_1 and Y_2 are H, OH or a sugar gp. (e.g. rutinose gp.) n is 1-3 and m is 1-5. (I), (II) and thei glucosides (e.g. gossypetin, quercetin, taxifolin, luteolin, eryodictyol, epigallocatechin, epicatechin, rutin, quercitrin, eriocitrin, etc.) show an excellent sterilising effect on alkyleneoxide polymers. Their stabilising effect can be further increased by using together with another antioxidant, e.g. tocopherol.

(I) or(II) is used at 50-1000 (500-800) ppm, w.r.t. alky -eneoxide polymer. 17.8.77 as 098520 (4pp5)

HATA/ ★ D21 30697B/16 ★J5 4032-639

Hair tonic prepn. - includes crushing mixt. of sesame, aloe, sea tangle and gardenia flower or barley, and mixing with shiitake extract and alcohol

HATA S 10.08.77-JA-095850
(10.03.79) A61k-07/06

Method comprises (1) mixing a crushed prod. of (a) sesame, (b) aloe, (c) sea tangle and (d) gardenia flower o barley, present in a wt. ratio of (a):(b):(c):(d) of 0.66-1: 0.46:0.33:0.06-0.13, (2) mixing the mixt. with a liq. mix composed of a small amt. of shiitake extract and alcohol, (3) maturing the mixt. and (4) filtering to remove solids.

Prod. is nontoxic and free from harmful after-effects. It gives refreshing feeling and shows a sterilising effect. The components activate hormones through their synergic effects and convert tyrosine to melanin, so it is effective to prevent the whitening of hair. 10.8.77 as 095850 (3pp5)

TOAE- ★ D21 30960B/16 ★J5 4033-88

A sanitary tampon, made of cotton- or rayon-type of wadding, is treated in a certain zone by a hydrophilic admixture of magnified absorption capacity. In the finished rolled tampon, the treated zone can lie in the centre or at either of the ends.

The tampon has, in addn. to its normal good absorption capacity, a suction reverse in case of a sudden fluid efflux. 3.10.77 as 744466 (12pp39)

Sterilisation of pharmaceuticals in flexible containers - withou distortion of containers by pressure increase in sterilising autoclave

PREBBLES MEDICAL LTD 15.09.76-GB-038131

B07 P34 (19.04.79) A23l-03/10 A61l-01

Filled and sealed flexible containers are sterilised by hea treatment. The containers are placed in an enclosure fo the heat treatment step and the enclosure is pressurised reduce the tendency of the containers to distort because c heat and internal pressure. The pressure is controlled b varying the admission of air and/or steam to the enclosu

Pref. the max. pressure reached is 1 to 2 atmosphere over normal atmospheric. Pref. the pressure is varied according to the temp.

The method is used to sterilise liquids e.g. pharmaceuticals packaged in flexible containers such as sachets. Sterilisation in a steam auroclave has previously been successful using rigid containers whereas flexible containers have tended to weaken and leak or burst resulting in a distorted unsaleable product. The present method overcomes these difficulties. 13.9.77 (4pp295)

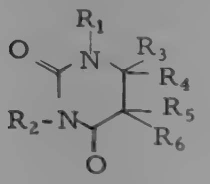
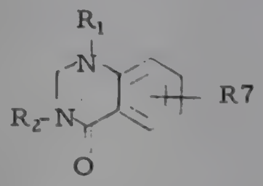
Activation of aq. solns. of per-cpds., i. e. H_2O and water insol. inorganic peroxyhydrates contg. 20-500 mg per litre of active oxygen is described. The soln. has a pH of 4-12 and a temp. of 10-70°C.

Process comprises adding to the soln. an activator of formula (I) or (II).



(I)



(II)

In the formulae, $\geqslant$ 1 of R_1 and R_2 is 2-4C acyl in benzoyl and the other is 2-4C alkanoyl or benzoyl. R_{3-6} are each H, 1-4C alkyl, 1-4C haloalkyl, 2-6 alkoxyalkyl, 2-4C carboxyalkyl or 3-6C alkoxycarbalkyl. R_7 is H, halogen 1-4C alkyl, CO_2Mg, SO_3Mo, amido, cyano, sulphamido or nitro (where m is alkal metal or ammonium).

Specifically (I) is 1,3-diacetyl-5,6-dihydrouracil. The activated solns. are used in washing and bleaching agents. The per cpds. may be activated at < 70°C. 29.3.77 as 782334 (11pp964)

PROC D25 64946Y/37 =US 4110-262

Builder free stable conc. liq. washing agents - contg. polyethoxylated nonionic wash-active cpd., a polybasic acid and a liq. carrier

PROCTER & GAMBLE CO 08.03.76-GB-009257
*A97 E19 (A25) (29.08.78) *BE-852-171 C11d-01/82 +C11d-07/50*

A liq. conc. homogeneous stable heavy duty detergent contains 20-70 wt.% soluble ethoxylated nonionic surfactant, 0.10-1.25 wt.% polyacid and the balance being a liq. carrier, pH of compsn. is 6.0-7.5.

Ethoxylated cpd. is ethoxylated alcohols contg. 2-24 mols. ethylene oxide. Alcohol is straight- or branched-chain prim- or sec-, satd. or unsatd. aliphatic alcohols contg. 8-24 C hydrocarbyl gp., 1-12C alkyl phenols where $\geqslant$ 1 alkyl gp. has $\geqslant$6C to yield $\geqslant$15C in alkyl gps.

Polyacid is ethylenediamine tetramethylene phosphonic acid, hexamethylene diamine tetramethylene phosphonic acid, diethylene triamine pentamethylene phosphonic acid or aminotrimethylene phosphonic acid.

Esp. used for washing or pretreating and washing heavily soiled cotton fabrics. 7.3.77 as 775214 (9pp931)

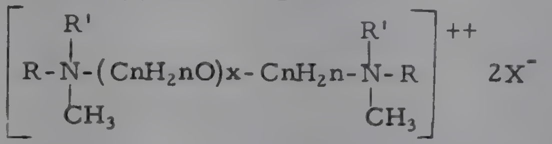
JOHJ D25 91499A/51 =US 4110-263

Mild cosmetic detergent compsn. esp. for shampoos and baths - contg. anionic or amphoteric detergent and bis quat. ammonium cpd.

JOHNSON & JOHNSON B 17.06.77-US-807768
*A96 E16 (29.08.78) *BE-868-215 +C11d-01/94*

Cosmetic cleansing compsn. is prepd. contg. a detergent component in admixture with an alkyleneoxylated bisquat. ammonium cponent.

Detergent component is $\geqslant$1 anionic and/or amphoteric detergent. Alkyleneoxylated bisquat. ammonium cpd. is $\geqslant$ 1 cpd. of formula (I) where R is 10-26C aliphatic, R' is Me, Et, Pr or R, X is an anion, n is 2 or 3, x is 1-30. Detergent compsn. is present to 4-40 wt.% compsn. and wt. ratio of (I) to detergent is 0.01-0.3:1.



$$\left[R-\overset{R'}{\underset{CH_3}{N}}-(CnH_2nO)x-CnH_2n-\overset{R'}{\underset{CH_3}{N}}-R \right]^{++} 2X^- \qquad (I)$$

Prod. is mild cleansing compsn. having reduced irritant properties. Esp. used in fluid detergent compsns. such as shampoos, bubble baths, baby baths, etc. 17.6.77 as 807768 (11pp931)

CPI INDEXES

ALERTING PATENTEE INDEX (II)

Weekly by section and overall, lists all current patents in patentee code order and, within a given patentee, in earliest priority date order. The first line gives patentee code, earliest priority date, patentee name, CPI classes and finally the current patent number. The second line gives the first part of the title, followed by the accession number.

CPI CLASS INDEX (IV)

Weekly only. Headings are all the CPI classes within the section to which an Alerting Bulletin relates, arranged in numerical order. Posted under each class heading is a list, in country then patent number order, of all basic or equivalent documents referenced or cross-referenced under that heading.

BASIC NUMBER INDEX (V)

Weekly by section and overall, lists all entries by accession number. Each heading consists of the accession number in bold, followed by the CPI section letters. There then follows a list of all the family members, commencing with the basic and finishing with the current week's patent. For each family member the CPI week of issue is quoted, and a plus sign indicates that a multiple priority has been claimed.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX 1

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740	
Germany, W. unexamined	1050	
Japan unexamined	845*	
Netherlands unexamined	240	
PCT	40	
Research Disclosure	20	
South Africa	100	
Sweden	260	
United Kingdom unexamined	600	3325

Slow publishing

Canada	450	
Germany, E.	100

Japan examined	340*	
Netherlands examined	60	
Soviet Union	1200	
Switzerland	260	
United Kingdom examined	300	
United States	1200	4375

*Only CPI coverage for Japan.

"Minor" Countries

Complete coverage, but only introduced during 1975, with exception of Italy 1978.

Fast publishing

Brazil	140	
Denmark	120	
Finland	60	
Norway	80	
Portugal	30	430

Slow publishing

Austria	125	
Czechoslvakia	180	
Hungary	35	
Israel	40	
Italy	155	
Rumania	25	560

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

HURK/ ★ D11 31576B/17 ★BE -871-403
/olumetric depositor for paste esp. edible paste - discharges excess naterial at constant pressure before delivering measured deposit
HURKMANS A 21.10.77-NL-011612
Q32 (20.04.79) A21c B65d

The depositor is of the type which comprises a supply hopper with an outlet having an exterior flat face to provide a sliding leakproof contact surface with the open end surface of a distribution cylinder. The distribution cylinder. The distribution cylinder contains a reciprocable ram and is first aligned with the hopper cutlet and charged by retracting the ram. The cylinder slides across the contact surface and reaches a delivery position where the ram is advanced to discharge the paste.

Between the charging and delivery positions the cylinder mouth is now temporarily aligned with a cylindrical overspill chamber. The overspill chamber contains a piston which is loaded, e.g. by spring pressure, towards the distribution cylinder. The ram forces a fraction of paste from the cylinder into the overspill chamber leaving a precise measure of paste in the cylinder for subsequent discharge at the delivery position.

Used for measuring out predetermined volumes of paste partic. pastry dough and other edible pastes. The measurement is precise and is made always at constant, acceptable pressure. The paste is never subjected to a sudden drop in pressure. The prod. wt. is adjustable but is constant, once set. Quality and vol. control are to a high standard. 20.10.78 as 871403 (13pp448)

High protein cellular diet food, e.g. wafer - contains sugar and protein consisting of casein opt. mixed with other protein sources (BE 17.4.79)
ROUSSEL UCLAF 17.10.77-FR-031163
(19.04.79) A21d-13/06 A23l-01/30

Foodstuff or dietetic material having a cellular structure contains $\geqslant 1\%$ sugar, esp. saccharose, and $\geqslant 40$ ($\geqslant 50$) esp. $\geqslant 60$, partic. $\geqslant 80\%$ protein consisting of $\geqslant 50\%$ casein. Plant protein and yeasts may also be used.

The high protein-contg. compsns. can have the appearance and taste of pastries, biscuits or confectionery, and a regular, repeatable shape, e.g. of bread, rolls, dry or filled biscuits, toast and wafers. 16.10.78 as 844992 (19pp200).

BRAS/ ★ D11 32048B/17 ★GB 2005-623
Automatic cake inverting device on hot plate conveyor - with blades on common shaft pivotable against direction of travel of conveyor
BRASH J 10.10.78-GB-039976 (12.07.77-GB-029285)
Q35 (25.04.79) A21c-15 B65g-47/24

Appts. for inverting cakes on a hot plate conveyor includes $\geqslant 1$ blade pivotable about an axis transverse to the length of the conveyor. The blades are pivoted against the direction of travel of the conveyor, pivoted through the vertical and then returned to their original position. The blades are decelerated after they have scooped up the cakes.

Machine for baking cakes, scones and pancakes. The inverting appts. is arranged to scoop cakes from the conveyor and invert them onto a stacking conveyor. The provision of two inverting devices ensures cooking of both sides of the cakes. The cakes can be inverted and left in a straight row. The stacking conveyor is moved less often than the baking conveyor so forming accurate piles of cakes. The cakes do not have to be stacked before they are packed. 10.10.78 as 039976. (5pp1044)

*(17.04.79) *GB1195-137 A21b-05 + A23l-01/10*

Potato crisps are formed, deep fried and discharged to a conveyor in an automatic continuous belt process. The potato dough for the crisp is cut from a continuous complementary belt so that the cut out portion comes to rest on one half of a matrix carried on the continuous belt conveyor.

The other half of the matrix is brought over the first half to enclose the dough which is immersed in a deep frying bath. The crisps then pass through a cooling trajectory before the matrix opens allowing the completed crisps to fall onto a discharge conveyor to pass through further treatment and packaging.

The machine functions fully automatically and allows the crisps to be produced at a higher rate than is currently possible. 27.6.68 as 009114 (14pp1370)

ROSP= ★ D11 32776B/17 ★SU -516-390
Pastry-confectionery articles prodn. line - has mould loading-unloading mechanisms as intermittently moving conveyors, with pivoted grippers for dough blanks
ROSPISHCHEPROMAVTOM 09.01.74-SU-987592
(00.00.00) A21c-15 A21d-13/08

Production line for multilayer pastry confectionery articles such as "souvenir" spiced cakes comprises dough-mixing machine, conveyor to supply the dough, shaping machine, and conveyor for the moulds with the dough blanks. The production is completely mechanised and productivity is improved by adding mould loader and unloader, mechanisms to extract the dough blanks from the moulds, to take the moulds away from the blanks, and to clean and grease them, plus a cooling cupboard with a system of conveyors.

The device to load and unload the moulds is made as intermittently moving conveyors with bars. The mechanism for extracting the dough blanks from the moulds consists of grippers on pivots fixed so that they can periodically rotate.

Treating and deep freezing of raised dough prods. - using instantaneous hyperfrequency heating followed by deep freezing
POUPARD M 11.10.77-FR-030599
(19.04.79) A21d-08 A21d-15/02
D/S: N(US) + E(CH, DT, GB, LU, SW).

Treating and deep freezing of bakery and Viennese bread prods. made of raised dough comprises heating the dough both internally and externally at 60-275°C by introducing instantaneous heat (using a specially designed oven) into the very core of the prods. for 15 s to 20 mins. This results in faster development of a hologically blown prod. free of coloration. The prod. is then set in its shape and structure by degressive deep-freezing at -180° to -25°C.

The prod. can be stored for several months at -25 to

to form prods. having the same characteristics as those of craftsmen bakers.
10.10.78 as FR0030.(9pp950).

NMHB ★ D12 31669B/17 ★DS 2810-574
Dispensing device for wooden spits - with one holder retaining penultimate spit as other releases last spit of stack
NORDISCH MASCH R BAADER 11.03.78-DT-810574
(19.04.79) A22c-07

A dispensing device for wooden spits, for use in preparing shashliks and similars dishes, consists of two pairs of holding elements for the spits which are stacked between vertical rods. One of the pair at each end is normally extended far enough to hold the stack of spits captive. If it is withdrawn, the second element of the pair presses with its front face against the last spit but one and retains it until the other element has returned under the stack.

The arrangement can deal with spits of varying dia. and is not affected by kinks or splinters which otherwise may lead to jamming. Only one spit is released at a time in a regular rhythm. 11. 3. 78 as 810574 (4pp39)

BAUE/ ★ D12 31752B/17 ★DT 2746-176
Sausage meat mincing machine - with flat nozzle injecting carbon di:oxide snow upstream of cutters and perforated discs.
BAUER W 14.10.77-DT-746176
P41 (19.04.79) A22c-11 B02c-18/30

Minced meat for sausages is prepd. by passing the fresh meat cubes through a mincing machine. Immediately ahead of the revolving cutter blades and perforated discs, carbon dioxide snow is sprayed over the meat at certain intervals.

The arrangement results in clean cuts of tendons and soft fatty particles, giving a better appearance and longer durability. The gas developed assists the mixing and filling process and enhances the taste of the sausage. 14.10.77 as 746176 (6pp39).

BETT- ★ D12 31907B/17 ★DT 2845-360
Hand-held trimming knife - with annular revolving blade and complementary adjusting ring for depth of cut
BETTCHER INDS INC 17.10.77-US-842584
P62 (19.04.79) A22b-05/16 B26b-25

A hand-held trimming knife, for cutting slivers of fat or skin from meat, bacon etc., includes a motor driven annular blade. An adjusting device for the depth of cut consists of a base part and an annular part. The latter has a shape, complementary to that of the blade and leaves a gap relative to it. Means are provided for the axial adjustment of the base part.

The depth of cut is easy to adjust. The trimming knife has an attractive appearance and gives the operator a clear view of the meat to be trimmed. 16.10.78 as 845360 (14pp39).

Minced fish meat prodn. - giving a good quality prod. from various fish of low freshness
SNOW BRAND MILK PRODUCTS 19.08.77-JA-099986
(15.03.79) A23l-01/32

The method comprises (1) mincing fish meal to give myofibrils in sol form; (2) washing with water; (3) dehydrating (4) adding aq. salt soln. to the obtd. ppte.; (5) diluting the mixt. with water; (6) dehydrating; (7) collecting the obtd. ppte.; (8) collecting the aq. soln. contg. water soluble protein discarded from (2), (3) and (6); (9) heating the soln. to coagulate protein; and (10) mixing the recovered heat-denatured protein in the ppte. obtd. in (7).

The fish meat protein is composed mainly of 60% actomyosin and 30% water-soluble protein. Water-soluble protein can be sepd. by breaking the myofibrils physically and chemically and washing with water. The yield of minced fish meat can be increased while keeping a good texture by recovering the removed water-soluble protein, heat-denaturising it and combining it with actomyosin. The minced fish meat has better texture than that obtd. conventionally. 19. 8. 77 as 099986 (6pp5).

AJIN ★ D12 32644B/17 ★J7 9006-623
Mutton and lamb flavour improvement - by adding asparagine, glutamine, alanine or glycine to meat before cooking
AJINOMOTO KK 00.00.70-JA-091341 (26.11.66-JA-077353)
(30.03.79) A23b-04

The aminoacids can be added to the meat by any method, e.g. mixing a soln. of the aminoacid with sliced meat, immersing the meat in the soln. rubbing the aminoacid in to the meat, or adding the soln. while grinding the meat. The amt. of the aminoacid added is 0.05-5 pts. wt. per 100 pts. wt meat. Addn. of a small amt. of xylose, glucose, etc. aids improvement of flavour.

The treated meat with seasoning, spices, etc. added can be and roasted, steamed, boiled or smoked. The trea-ment kills unpleasant odours peculiar to mutton or lamb and adds flavour, without the use of spices. 26. 11. 66 as 091341/70, Div. ex. 77353/66, A23b-4/00 (30. 3. 79) AJINOMOTO KK (3pp83)

Cleaning of cooked shrimps one at a time
MACHINEFAB BEDRI NV (BED -) 14.03.68-NL-003635
*(17.04.79) *FR2003-934 A22c-29/02*

Machine for peeling boiled shrimps comprises a series o steps in which the individual shrimp is gripped, stretched the head is cut away and the meat is removed. The last step occurs in two stages: first, the tail is pinched so tha the meat is pushed out, then the tail is removed and the meat is pushed entirely out of the body shell.

The process enables the shrimp meat to be obtd. fully intact with no wastage due to residue left in the tail. 14.3.68 as 003635 (13pp1370)

BSBE- D12 04276R/05 =NL -159-86
Device for stopping a flow of shrimps onto a conveyor - an releasing them singly in succession
MACHINEFAB BEDRI NV 14.02.68-NL-003636
*(17.04.79) *FR2003-935 A22c-29/02*

Shrimps on a moving flat belt conveyor are spaced at inte vals to coincide with the timing of the following treatmen machine by means of a stop which is mounted on a vertical slide. The stop consists of two vertical plates inclined towards each other in the direction of motion of the belt so that the shrimps pass through a passage decreasing in width. The outlet is just sufficient to enable an undamaged single shrimp to pass through. The outlet also determines the position of the shrimp on the belt without changing its orientation.

Immediately after the stop, there is a transverse slide and pusher which sweeps across the belt in step with the movable stop. Shrimps that pass through the stop and which are thus correctly oriented and undamaged pass ahead of the sweep. Shrimps that are held up by the stop are pushed off the belt by the sweep. 14.3.68 as 003636 (7pp1370)

BSBE- D12 04277R/05 =NL-159-864

Device for turning curved shrimps into alignment on - a conveyor belt

MACHINEFAB BEDRI NV (BED -) 14.03.68-NL-003637

*(17.04.79) *FR2003-936 A22c-29/02*

Device inverts shrimps which are laid incorrectly on a horizontal conveyor belt. The belt passes over a rigid support surface, and a horizontal slide, at the end of which there are two pins, one vertical and one horizontal, moves across the belt. The shrimps lying correctly are pushed by the vertical leg across the belt and prevented from rolling by the horizontal leg.

At the side of the belt are two rails attached via levers to a pivot and counterbalance. One of the rails lies just below the level of the belt upper surface so that shrimps laid incorrectly are pushed tail first across the rail by the slide. The sideways movement continues until the shrimps are stopped by the second rail which is at body height but high enough so that the tails of shrimps laid incorrectly can pass under it. The two rails then swing upwards leaving the correctly laid shrimps as they were but rolling the others over.

The device is placed after a conventional orientating device and ensures that 100% of the shrimps are lying correctly before being fed into the next stage. 14.3.68 as 003637 (18pp1370)

Automatic shrimp peeling machine - aligning straightening out and flesh from head, tailand shell

KOCKEN A (KOC /) 08.05.72-DT-222513 (23.02.72-DT-208476)

*(17.04.79) *NL7211-720 A22c-29/02*

Appts. is described for automatically peeling shrimps which have been killed in boiling water and are consequently curled up. The machine comprises a feeder which presents the shrimp, head foremost and back down onto a peeling wheel. The wheel has elliptical indentations around its perimeter which receive the shrimp back and hold the shrimp by vacuum. It then passes through an abrading device, a cutter and a device which removes the meat from the peel. Finally, the residual peel lying in the indentation is removed by compressed air.

The machine produces shrimp meat free of peel or any other undesired parts of the shrimp. 28.8.72 as 011720 (16pp1370)

Hydraulic evisceration of marine molluscs - using high velocity fluid stream which shears belly portion from clam meat

AMER CORP 28.09.77-US-837183

(10.04.79) A22c-29/04

The belly of a clam is separated from the remainder of the clam meat by introducing a whole clam body into a fluid shearing zone where a high velocity stream creates forces sufficient to shear the belly from the clam body. Appts. includes a clam introduction conduit which only allows passage of whole clam bodies in single file. A slitting device is disposed in the conduit inlet to slit the peritoneom of the bodies as they pass through the conduit. The bellies are recovered from the clam meat separately. The fluid shearing zone comprises the intersection of the clam introduction conduit and a high velocity fluid conduit.

The bellies are removed from the whole clam bodies without any structural damage to the remaining clam meat. The appts. is useful for all species fo clams including the ocean quahog. 28.9.77 as 837183 (4pp1044)

Foodstuff extrusion die contg. elongated passages - with common V/shaped inlet for attachment to conventional food grinder

COLOSIMO G A 06.09.77-US-830838

(10.04.79) A22c-07

An extrusion die for use in a food forming press comprises parallel extrusion passages extending through a housing. A V-shaped common inlet is formed at one end of the housing and forms angled sharp edges between the passages. The discharge ends of the passages are flush with one another. A bottom portion extends beyond the flush ends and has side walls which extend upwardly from the portion and converge slightly as they extend from an end wall of the housing.

Used e.g. for mfr. of skinless link-style sausages and artificial meat products. The extruder die can be connected directly to the discharge of a conventional food grinder The extruded foodstuff is forced down a ramp where it falls and unrolls onto an incrementally pre-marked paper that provides a continuous base for the extruded ribbons. This permits rough sizing of the extruded ribbons prior to freezing and accurate cutting to precise size and wt. 6.9.77 as 830838 (5pp1044)

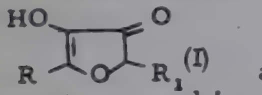
Prodn. of dihydrofurans of formula (I) comprises cyclisation of dikeontes of formula RCHOH.CO.CO.CHOH.R_1 (II) in presence of an insoluble cation exchange resin as catalyst in the reaction medium.



(I)

In the formulae, R and R_1 are both CH_3, or one is CH_3 and the other C_2H_5. Reaction is pref. at 50-150°C under an inert atmos. and in aq. or aq. alcoholic soln.

(I) have organoleptic properties which make them useful in food, pharmaceuticals and perfumes. C.F. the use of dissolved acid catalysts, sepn. of catalyst for reuse, and recovery of (I) are simplified, and (I) is so pure (95%) that no further purificn. is necessary. 20.10.78 as 871421(6pp)

WYSS ★ D13 31622B/17 ★BE-872-899
Treating whole grain cereals to obtain better animal feed - by enzymatic decomposition of the starch to dextrose
ESCHER WYSS GMBH 21.12.77-DT-757036
C03 (17.04.79) A23k

Starch contained in the cereals is saccharified by enzymatic decompsn. to form dextrose. All the cereal substances in the grain are treated at the same time to the enzymatic decompsn. After the starch in the grain has been converted to dextrose, the prod. is dried.

Simple, inexpensive process gives a prod. with a better nutritive effect for animals, the nutrients being better used than in the case when the untreated cereal is used. 20.12.78 as 872899 (11pp597)

DYNL ★ D13 31634B/17 ★BE-872-951
4-3-Sulpho-4,5-di:hydroxy-hexyl:oxy 4'-alkoxy di:hydro-chalcone(s) - used as synthetic sweeteners and prepd. from flavonone deriv. with epoxy-sultone
DYNAPOL 22.12.77-US-863116

Treating organic waste by anaerobic fermentation - to produce methane and dry residue for animal feed
GRENET E P 21.07.77-FR-022386
C03 P11 (D16) (23.03.79) A01c-03/02 A23j-01/18 C02c-01/14 C05f-13 C12d-03/10

Air is removed from an open fermentation receiver from the top, after charging the organic waste and filling it completely with water. The medium is then inoculated with methane-generating bacteria and also cellulolytic bacteria the waste contains cellulose; the receiver is shut and the methane evolved is collected via a conduit at the top. After evolution has stopped, the fermented waste is recovered and dried by evaporation.

A fermentation dose of methane generating anaerobic bacteria for use in the above comprises a nitrogenous culture medium placed in a pressure resistant metallic container closed by a perforated metal stopper packed with a filter of carded cotton. A similar dose of cellulolytic anaerobic bacteria comprises a medium opt. contg. a cellulose material.

Process is effected in an appts. comprising a sealed fermenter provided with a safety valve and a branched methane conduit at the top and a lid of 40-50cm. dia.

The dried fermentation waste is used in animal feeds. The process avoids either a pre-aerobic fermentation or a preheating required in previous processes. 21.7.77 as 022386 (15pp597).

Prepn. of dried gourd shavings - by first slicing intermediate pulp layer of bottle gourd fruits
NICHINAN KK 08.07.77-JA-080999
(15.03.79) A23b-07/14 A23l-01/21

Process comprises (a) slicing the intermediate pulp layer of bottle gourd fruits in thin strings with a slicer; (b) steeping the strings in aq. soln. of alkali or alkali salt; (c) drying in air; (d) smoking with S in a closed room; (e) drying again in air; and (f) preserving by packaging in synthetic resin bags opt. after restoring with water and seasoning.

Prods. are resistant to browning and attack by mould. 8.7.77 as 080999 (6pp5).

AJIN ★ D13 32358B/17 ★J5 4035-233
Packaged white mushroom prepn. - by boiling raw mushroom in aq. soln. of basic aminoacid and packaging
AJINOMOTO KK 22.08.77-JA-100247
(15.03.79) A23l-01/21

The method comprises boiling raw mushrooms in an aq. soln. of basic amino acid or its salt and packaging it as usual. As basic amino acid, lysine, arginine and their salt such as carbonate, hydrochloride, the salt with acidic amino acid, etc. can be used. Usually ascorbic acid or its salt is dissolved in an amt. of 0.05-0.2(0.07-0.15)g. in water 100ml. and basic amino acid or its salt is dissolved in an amt. of 1-20(5-15)g. in the soln.

The taste and flavour in mushroom is hardly dissolved out and delicious packaged mushroom can be prepd. By combining ascorbic acid in the aq. soln., browning of mushroom is prevented. 22.8.77 as 100247 (4pp5).

NAKA/ ★ D13 32359B/17 ★J5 4035-234
Seasoning and enriching agent - prepd. by mixing extract of Laminariales and extract of Cyanophyta or Chlorophyta
NAKAZAWA T 25.08.77-JA-102044
(15.03.79) A23l-01/30

The agent is prepd. by mixing extract of Laminariales and extract of Cyanophyta or Chlorophyta homogeneously. By combining the extracts they show synergic effect and desirable healthy and nutritive effects which cannot be expected by taking them singly.

Typically, fine sea tangle pieces 400g. and powdery Spirulina 400g. are mixed and the mixt. is extracted with 1600-2000ml. of ethanol for 50 hrs. The extract is filtered and refined water 3000-3500ml. is added to the filtrate. Then it is heated to 30-40°C for vaporising ethanol. The obtd. soln. is then treated by spontaneous vacuum cooling to obtain fine powdery prod. 25.8.77 as 102044 (3pp5).

KIBU- ★ D13 32360B/17 ★J5 4035-236
Strengthened soy bean protein dispersion gel prepn. - by adding ethanol to dispersion obtd. from soy bean protein in water and opt. edible oil mixt., to improve texture of resulting food prods.
KIBUN KK 23.08.77-JA-100119
(15.03.79) A23j-01/14 A23j-03

The method comprises (i) combining ethanol in the dispersion of soy bean protein which is obtd. by dispersing isolated soy bean protein in water or the mixt. of water and edible oil and pref. (ii) preparing pasty food from the soy bean protein dispersion obtd. by mixing paste or fine pieces of animal protein or vegetable protein with it, moulding the mixt. and heat-coagulating the mouldings.

By combining ethanol 1-10 v/v% in the paste or the emulsion of sepd. soy bean protein, the strength of the gel obtd. by heat-coagulating the paste or the emulsion of soy bean protein, can be improved. Texture of various pasty food contg. soy bean protein can be improved. 23.8.77 as 100119 (4pp5).

NISW ★ D13 32362B/17 ★J5 4035-240
Pasty food mfr. using soybean protein - opt. contg. gluten, by combining with guar gum in animal or fish meat
NISSHIN OIL MILLS KK 24.08.77-JA-100595
(15.03.79) A23l-01/32

The method comprises combining (a) soy bean protein or soy bean protein and gluten and (b) guar gum in animal or fish meat and prepg. pasty food as usual.

A pasty food of good quality can be prepd. with good workability without the problems of the prior art. The mixt. is hard enough for treating it easily without adhering to wall of the vessels and without the deformation of mouldings. Thus by the method pasty food can be prepd. inexpensively using soy bean protein without reducing the quality and the nutritive value. 24. 8. 77 as 100595 (4pp5).

NIYU- ★ D13 32363B/17 ★ J5 4035-243
Quality-improving agent for food and drink contg. lactic and bacteria - comprises low molecular peptide obtd. by decomposing skeletal muscle of Cervoidea animal
NIPPON YUKON KK 23.08.77-JA-101410
(15.03.79) A23c-09/12

Quality-improving agent (I) is composed of low molecular peptide obtd. by decomposing the skeletal muscle of the animal of Cervoidea.

(I) is (a) soluble in water and in aq. <80% ethanol soln.; (b) positive to Biuret reaction, Ninhydrin reaction and Pauly diazo reaction on its aq. 0.1% soln.; (c) negative to Ehrlich reaction and Sakaguchi reaction on its aq. 0.1% soln.; (d) has max. absorption at ~275nm and less max. absorption at ~255nm. for UV.; and (e) viscosity 7.0-7.5 cPs. (at 25°C, by Brookfield viscometer) on aq. 18% soln.

With (I) the starter of lactic acid bacteria which can form the soft curd showing high acidity, can be prepd. and can be easily mixed homogeneously with the starting subst-rate. In the major fermentation it greatly promotes the lactic acid fermentation. 23. 8. 77 as 101410 (3pp5).

CISC- ★ D13 32365B/17 ★ J5 4035-245
Crackling sugar confectionery contg. gas bubbles - is prepd. by melting the sugar, contacting with high pressure gas under stirring and cooling
CISCO KK 23.08.77-JA-100882
(15.03.79) A23g-03

The method comprises heat—melting sugar, contacting the melted sugar with gas under the pressure higher than atmospheric pressure (pref. 150-3000kg/cm^2) with stirring to enclose gas in the melted sugar and solidifying it by cooling.

As the sugar, e.g. fructose, glucose, arabinose, sucrose, lactose, maltose, etc. sugar alcohols such as sorbitol, mannitol, etc. and sugar acids such as gluconic acid, etc. can be used. As the gas, air, N_2, CO_2, etc. can be used favourably. In the melted sugar edible acid (e.g. citric acid, tartaric acid, adipic acid, fumaric acid, etc. and their salts), perfume, colourant, etc. may be combined freely.

The sugar confectioneries such as candy, which can keep enclosed gas stably in them for long time, can be prepd. and they can be easily broken in mouth with releasing enclosed gas and crackling softly. 23. 8. 77 as 100882 (3pp5).

KAOS ★ D13 32366B/17 ★ J5 4035-248
Imitation dairy food prepn. - using sorbitan fatty acid mono-ester of specific HLB as emulsifier
KAO SOAP KK 24.08.77-JA-101342
(15.03.79) A23c-09/10 A23c-11 A23c-13 A23g-09

The method comprises using the sorbitan fatty acid monoester, which has HLB value above 8 and is composed of 14-22C satd. fatty acid, as the emulsifier.

Imitation dairy foods are defined as the foods (e.g. ice cream, cream of coffee use, whipped cream, etc.) of which milk component is part or wholly replaced with analogous components such as vegetable oil and fat, skim milk, powdery skim milk, etc. In prepg. ice cream with the emulsifier (a) proper maximum overrun can be attained in a short time; (b) good form-holding property can be attained; (c) good texture and good after-taste. In prepg. whipped cream (a) proper maximum overrun and proper viscosity can be attained; (b) form-holding property appears in a short time; (c) even after 15 hrs. the form can be kept in original form.

Sorbitan fatty acid monoester is combined 0.01-3.0 (0.2-1.0) wt.% in starting material. 24. 8. 77 as 101342 (11pp5).

IDEK ★ D13 32367B/17 ★ J5 4035-249
Water-soluble yeast protein drink prodn. - is free of specific taste and odour and can be used for babies, sick people etc.
IDEMITSU INDUSTRIES KK 22.08.77-JA-099487
(15.03.79) A23l-02/38

The method comprises (1) washing crushed yeast with a mixed soln. contg. (a) oxalic acid and/or citric acid and (b) (m)ethanol at <70°C, (2) extracting it with aq. alkaline soln. contg. sodium hydroxide, potassium hydroxide and/or ammonia at 35-80°C and pH 11-13.5, (3) pptg. protein from the extract at the isoelectric pt., (4) adjusting the pH of the ppte. to neutral, (5) dissolving the obtd. yeast protein in water, (6) adding oil, fat and emulsifier to the aq. soln., (7) opt. adding sugar, colourant, perfume, etc. to the soln. and (8) homogenising the mixt.

The yeast protein drink is well balanced nutritionally and is highly soluble in water. 22. 8. 77 as 099487 (5pp5).

MITN ★ D13 32443B/17 ★ J5 4035-883
Oxygen adsorbent used in food containers etc. - comprises iron powder coated with metal halide and opt. binder and/or alkaline substance
MITSUBISHI GAS CHEM IND 26.08.77-JA-102353
E36 G04 (16.03.79) A23l-03/34 B01d-53/16

An oxygen absorbent is prepd. by coating 100 pts. wt. of iron powder with 5-10 pts. wt. of a metal halide, together with a binder and/or an alkaline substance if necessary, by using a metal halide soln. contg. binder and/or alkaline substance, and then the coated iron powder is dried until the moisture content becomes ≤1 wt.%. Metal halide is e.g. alkali(ne earth)metal halide.

The absorbent has a great oxygen absorption capability without defects, e.g. becoming wet on standing, contamination of foods, generation of hydrogen during storage, absorption of atmospheric oxygen during storage, etc. and thus exhibits its great power within a confined container for foods, etc. 26. 8. 77 as 102353 (7pp117).

NIOF ★ D13 32517B/17 ★ J5 4036-30
Highly emulsified fluid confectionery shortening - contg. (un)satd fatty acid ester of poly:hydric alcohol, and oil fluid at 0 degrees C
NIPPON OILS & FATS KK 27.08.77-JA-102186
(D11) (17.03.79) A23d-05

The shortening is obtd. by the addn. of 5-30 wt.% of satd. fatty acid (16-24C) ester of polyhydric alcohol (i.e. hard emulsifier) and 1-40 wt.% of satd. fatty acid (2-14C) este and/or unsatd. fatty acid (16-24C) ester of polyhydric alcohol (i.e. soft emulsifier) to an oil that is fluid at 0°C (e.g. corn oil, rapeseed oil, bean oil, etc).

Shortening has favourable fluidity at low temp. (e.g. at 0°C), and has favourable miscibility to cake at its making using continuous cake mixer. 27. 8. 77 as 102186 (5pp170).

IKED/ D13 04729Y/03 =J7 9006-61
Hydrogen peroxide bleaching method for foods - using condense phosphate obtd. from alkali and phosphoric acid, this reducin peroxide amt. used
IKEDA S 28.05.75-JA-064453
*E37 (30.03.79) *J51139-644 A23l-01/27*

Bleaching method is provided for foods using hydrogen pe -oxide. The amt. of hydrogen peroxide is restricted to < 0.1 g in 1 kg of food for Japanese noddles, boiled fish pa te and 'chikuwa' and < 0.03 g in 1 kg of other foods.

Soln. of hydrogen peroxide-bleaching agent is used by adding at least 0.1 w/w % (based on H_2O_2) of condensed phosphate having molar ratio of M_xO/P_2O_5 < 1.5 (M is al ali(ne earth) metal, x is 1 or 2).

The condensed phosphate can be obtd. as a glassy substance by mixing hydroxide of alkali (ne earth) metal, wit aq. < 75 w/w % phosphoric acid soln. or P_2O_5 so that the molar ratio of MxO/P_2O_5 lies in above range, heating the mixt. at 600-900°C for 10 mins. 24 hrs. for condensn. an cooling the reaction prod. rapidly.

The condensed phosphate itself is nontoxic and can pr mote the bleaching activity of H_2O_2. Thus the amt. of H_2O applied for bleaching foods, can be decreased to half or less without decreasing the bleaching effect. 28. 5. 75 as 064453, A231-1/277 (30. 3. 79) IKEDA S (5pp)(J5 1139644

KAOS D13 39540A/22 = J7 9006-619

Peeling fruit and vegetables in aq. alkali soln. - contg. nonionic surfactant, e.g. polyoxyethylene sorbitol fatty acid ester and glycerol, sorbitol mannitol, sugar, vitamin/C or urea

KAO SOAP KK (TOXO) 05.10.76-JA-119628
*A97 (30.03.79) *J53044-647 A23l-01/21*

The fruits or vegetables are immersed in aq. alkali peeling soln. contg. (a) 0.005-1.0 wt % nonionic surfactant of HLB 6-16 selected from polyoxyethylenesorbitan fatty acid ester sucrose fatty acid ester, sorbitan fatty acid ester, glycerin fatty acid ester and propyleneglycol fatty acid-ester, and (b) 0.005-1.0 wt % glycerol, sorbitol, mannitol, sugars, vitamin C or urea.

With 0.1-1(0.2-0.5) wt % dil. alkali soln. the peeling of fruits and vegetables (e.g. orange, peach, pear, apple, apricot, grape, tomato cucumber, radish, etc.) can be effected easily in a short time (ca. 30 mins) at relatively low temp. (ca 30°C) with little breakage. The peeled fruits or vegetables have excellent flavour, glossiness and hardness. Waste water from the process can be easily coagulated with calcium hydroxide and the load on the waste water treating process can be decreased greatly. As alkali caustic soda is pref. used and as sugar fructose, glucose, maltose and sucrose can be used. 5.10.76 as 119628 A231-1/21 (30.3.79) KAO SOAP KK (8pp5) (J5 3044647)

SUMI- D13 29349A/16 = J7 9006-620

Processed banana prepn. having excellent taste and flavour - by blanching peeled banana, decomposing starch with amylase, mashing and mixing

SUMISHO FOODS KK 19.08.76-JA-098868
*(30.03.79) *J53024-051 A23l-01/21*

Method comprises decomposing starch by blanching peeled banana in aq. soln. of pH 2.5-4.2 contg. acid, alum and polyphosphate adding α-amylase to blanched banana to decompose starch, followed by mashing and mixing.

Viscous pasty processed banana food excellent in preservative property is obtd. having vivid pale yellow colour which does not turn brown. Processed banana feed can be further processed to cream, jam, etc. 19.8.76 as 098868 A231-1/212 (30.3.79) SUMISHO FOODS KK (3pp) (J5 3024051)

Protein extn. from soya oil-cake - by grinding in caustic soda soln. contg. higher fatty acid salts

FATS RES INST 21.06.74-SU-036932
(D23) (09.08.78) A23j-01/14

Proteins are isolated from soya oil-cake by extn. with NaOH soln., acidifying the soln. to ppte. the proteins, neu- tralising the latter and drying the suspension. A better yield, coupled with less denaturing is obtd. as follows: before extn. the initial oil-cake is mixed with aq. NaOH and 12-20C fatty acids, or their alkali metal salts. During extn, additional grinding of the oil-cake in the soln. is also conducted. Soya oil-cake and NaOH soln. are used in the ratio 1:3-1:7 and fatty acids are used in quantities 0. 1-0.005 wt.%.

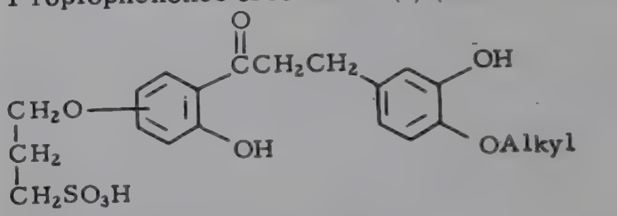
Propiophenones of formula (I) (where "alkyl" is 1-4C) and

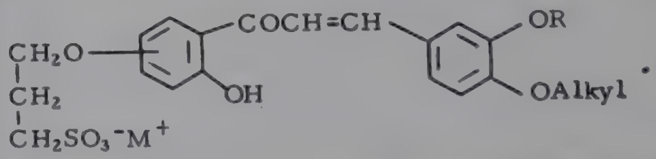


(I)

their salts have been prepd.

(I) are non-calorific sweetening agents related to the known sweetening agent hesperetin dihydrochalcone rutoside. They have the advantages of high solubility, stability to heat and acids, lack of toxicity, and high sweetening power.

(I) are prepared by reducing cpd. of formula (II):



(II)

In formula (II), R is H or a hydrogenolytically removable grp., pref. benzyl or benzyloxycarbonyl, and M$^+$ is H$^+$ or a cation.

JAGN ★ D14 31645B/17 ★BE -873-023
Automatic dispenser of tiny doses of liq. - esp. hydrogen peroxide, to sterilise plastic coated milk cartons before filling
JAGENBERG WERKE AG 24.12.77-DT-757897
Q39 R13 (17.04.79) A23p B67d G01f

A dosing machine injects tiny quantities of liq., of the order of 0.1-1.0 cm^3, into containers to be sterilised. The dose is measured by a pulse counter, one pulse per shot delivered from a measuring chamber. The measuring chamber is replenished from a reservoir in response to signals from high and low level detecotrs in the measuring chamber.

In this addn. at a low level signal a pump delivers from the reservoir to the measuring chamber a vol. of liq. sufficient to take the surface level above the high level detector i. e. a recharge batch vol. The pump is submerged in the liq. in the reservoir and comprises an inner pipe leading to the measuring chamber. The inner pipe has an open bottom which is enclosed in an intake bell leading up to a compressed gas pipe coaxially surrounding the inner pipe. The intake bell has a non-return value through which it is filled by the liq. from the reservoir. The vol. of the bell is slightly more than that of the measuring chamber between the level detectors. The detectors actuate gas supply to the pump.

Very simple, compact, inexpensive pump operates by gas, pref. air, displacement. 22.12.78 as 873023 Add to 864242 (16pp448)

Appts. for storing used cooking oils in a restaurant facilit having a kitchen area comprises a used oil dump receptable having an inlet screen connected to a storage container distant fromthe kitchen area via a heated pipe coupling A heating tube passes through the connecting pipe and communicates with a coil extending through the storage container.

A pump removes used oil from the storage container and is deenergised when a sensor senses removal of most of the oil from the container. A temp. sensor is provided for the oil in the appts.

The dump station can be mounted in a wall of the kitche area and the storage container is located away from the area, e.g. below ground level. The temp. sensor permits monitoring so as to maintain the liquidity of the cooking oi from the drainage point and during storage. 25.8.76 as 717472 (6pp1044)

Frame support for centrifugal honey extractor - having slotted uppe plate and apertured lower plate on rotatable shaft for receivin combs

GAMBLE B R 21.02.78-US-879199

(10.04.79) B01d-17

The extractor comprises a honeycomb frame having an ex-ension on one end of a top bar, a honeycomb frame support structure and an outer container which receives the support. The support includes a central supporting shaft and a lower retaining plate having apertures for the extensions on the honeycomb frames. An upper retaining plate has a series of radially extending slots arcuately spaced around the shaft. The slots are shaped and dimensioned to receive the honeycomb frames when they are seated in the lower retaining plate.

When the support is rotated the honey inside the comb is extracted by centrifugal force, and thrown across the spaced between the retaining plates for collection from the side walls of the container.

Used as a small capacity centrifugal honey extractor, designed for the hobbyist or home operator. The frame support has few movable parts and is easy to manipulate. The extractor effects rapid and max. extn. of honey from the combs. 21.2.78 as 879199 (5pp1044)

Aerator with vertically adjustable drive mechanism - using hydraulics to provide independent control of separate agitators
LANDUSTRIE SNEEK 19.10.77-NL-011505
(19.04.79) B01f C02c

Mechanical aerator consists of a paddle whose function is to beat air into a fluid such as effluent in a biological treatment, a drive motor and transmission and a support device which permits the vertical position of the agitator to be adjusted in accordance with the oxygen demand of the fluid. The vertical adjustment is pref. achieved by mounting the agitator drive shaft in bearings within a vertical cylinder.

The cylinder is equipped with external rings fitted between it and an outer fixed cylinder. Hydraulic fluid may be introduced into the annular space so formed either above or below the rings enabling the mounting cylinder to be raised or lowered. To prevent the motor and drive from freely rotating about the shaft, an arm protruding from the motor is equipped with a roller which moves against a vertical guide stop fixed rigidly to the beam supporting the agitator assembly. The vertical guide is preferably marked in such a manner that the elevation of the agitator can be read.

The device enables a number of separate agitators to be independently adjusted and lends itself readily to either automatic or manual control. 19.10.78 as 871368 (9pp1370)

Purificn. of water with magnetic sepn. of pptd. sludge - using aluminium and/or ferrous sulphate-contg. magnetic material as pptn. agent
BOLIDEN AB 24.10.77-SW-011948
(23.04.79) C02c

The process uses a crystalline pptn. agent based on $Al_2(SO_4)_3$ and/or $FeSO_4$ together with a magnetic material. The magnetic material is added to the $Al_2(SO_4)_3$ or $FeSO_4$ when it is in soln. form, or a molten mass prior to crystallisation. The pptn. agent prepd. with the Al or Fe cpd. is also novel.

Incorporating the magnetic material in this way, enables a uniform distribution of it in the pptn. compsn. based on the $Al_2(SO_4)_3$ and/or $FeSO_4$.

The pref. magnetic material is magnetite or other magnetic iron oxide such as is obtd. during roasting of pyrites to obtain magnetite. The material is pref. $< 8\,\mu$ esp $< 3\,\mu$, in particle size. The amt. of magnetic material in the compsn. is pref. 1-50 (2-30)% esp. 3-10%. The pptn. agent compsn. pref. also contains active carbon. 23.10.78 as 871458 (21pp597)

BREV ★ D15 31612B/17 ★BE -872-867
Flexible stratified mass transfer element - comprises upper and lower layers enclosing active material and held together by fibres distributed densely over whole surface
BREVE TEAM SA 23.11.78-CH-012022 (24.12.77-CH-015944)
C03 J04 K07 P73 (D22 J01) (17.04.79) B01j B32b

Stratified flexible surface element for treating a gas or a liq. brought into contact with it consists of a fibrous or granular active material contained between an underlying layer and a covering layer contg. fibres, permeable to the gas or liq. The underlying layer and the covering layer are held together by fibres passing through them individually or in tufts at places distributed densely over the whole surface and anchored in the underlying layer as well as the covering layer.

The active material can operate by emission, sorption or catalysis. The particles can transfer e.g. fertilisers or plant protection materials to water in circulation. The active material can be an absorption or adsorption agent, e.g. active carbon, vermiculite, in the form of grains or fibres, for suppressing odours, or an ion exchanger for water softening, or a catalyst foe petroleum treatment or it can emit perfumes or bactericides into the air.

The element overcomes disadvantages associated with variations in permeability at different parts. The holding fibres have an open structure and the outer and inner pts. are freely accessible at all places, to the medium being treated. The thickness is uniform so that the layers are parallel. The element can be cleaned or regenerated easily e.g. by washing or blowing. 19.12.78 as 872867 (20pp)

Two-zone activated sludge tank to purify waste water - offers high efficiency treatment by repeated inter-zone transfer for intermittent aeration

SIMON HARTLEY LTD 22.12.78-BE-873021

(17.04.79) B01f C02c

The tank is of the type in which the water is agitated by an aerator, e.g. a rotary impeller, The aerator is surrounded by a partition enclosing an inner zone of liq. and an annular outer zone of liq. is held between the partition and the outer wall of the tank. A passage is formed through the partition at or near surface level and another passage at or near tank base level. The aerator creates a flow of liq. through a passage from the inner zone to the outer zone. The transferred liq. circulates around the outer zone before finding its way back to the inner zone via a different passage.

The passages are pref. formed and positioned and related to the direction of rotation of the aerator so that flow is outwards from the inner zone via upper passages and inwards from the outer zone via lower passages. The tank is pref. of vertical cylindrical form with a coaxial, vertical cylindrical partition around a central aerator.

The treated effluent can be equal to that delivered from the conventional 3-stage process, i.e. free of ammonia and probably nitrates too. For such effective treatment the new plant is very compact and inexpensive. 22.12.78 as 873021 (10pp448)

SIMON HARTLEY LTD 20.07.77-GB-030424
(23.03.79) B01d-17/02 B01d-21

The overflow weirs are constructed to eliminate the necessity for junction plates between the adjacent plates of which the weirs are composed. They consist of long plates fixed together end to end, $\geqslant$1 end of each plate being stepped to receive an end of the adjacent plate in a way such that the two ends overlap. Holes are provided in the ends of the plates so that when they are overlapped, the holes coincide allowing screws to pass through, thus both fixing the plates relative to each other and to the wall of the tank. 20. 7. 78 as 021557 (8pp1330).

ITDE- ★ D15 31999B/17 ★FR 2398-023
High thermal efficiency solar energy desalination process - used to produce drinking water from sea water, etc.
SOC INT DESSALEMENT 22.07.77-FR-022659
(23.03.79) C02b-01/06

High pressure steam raised in a solar energy boiler is expanded directly into a turbine driving a vapour compressor. Exhaust steam from the turbine is passed into a desalinator circuit to transfer heat indirectly to raw water which is thus converted to vapour while the exhaust steam is condensed.

The vapour is piped to the intake of the compressor which delivers compressed vapour to the inlet end of the desalinator circuit. The desalinator circuit discharges condensate which is partly drained off as drinking water and partly recycled to the solar energy boiler to produce high pressure steam.

Solar energy alone is required to power this process which operates at a high thermal efficiency. 22. 7. 77 as 022659 (9pp448).

CARB- ★ D15 32000B/17 ★FR 2398-024
Transportable oxygenator to purify water in lakes - has oxygen cylinder on float which supports immersed diffuser
CARBOXYQUE FRANCAIS 19.07.77-FR-022107
(23.03.79) C02b-01/34

The oxygenator comprises a float which supports a cylinder of compressed oxygen with its outlet valve above the surface and within a protective, pref. transparent, cover. The cover also houses a reducing valve and pressure regulator as well as pressure gauge(s) as required.

connectors, pref. chains, support an immersed sparge pipe with nozzles to diffuse oxygen supplied by a flexible delivery tube from the pressure regulator.

Used for purificn. of water in lakes by injection of oxygen. The equipment is inexpensive, simple to use and to maintain, and is readily transportable. Ideal for temporary use in a number of scattered pools. 19. 7. 77 as 022107 (6pp448).

SAEM- ★ D15 32001B/17 ★FR 2398-026
Powered reciprocating rake to clear waste water screening grill - has compact and robust twin chain transmission
SAEMI SARL 19.07.77-FR-022996
(23.03.79) C02c-01/22

The rake is of the type which is driven via a geared transmission with a hollow output shaft. A toothed rake plate is reciprocated by drive arms linked to a cross bar carried transversely between a pair of parallel, endless conveyor chains. The conveyor chains are driven on duplex sprockets which themselves are chain driven from the hollow output shaft. The rake drive arms are joined by a transverse stiffener which is extended to run in crosshead guide channels.

Used for automatic cleaning and unblocking of straining grills used to screen waste water prior to purificn. The construction is robust, compact and operates efficiently with little servicing. 19. 7. 77 as 022996 (10pp448).

Electrolysis of domestic waste-water - first in cell with aluminium anode and cathode to coagulate solids, then in cell contg. granular activated charcoal

HITACHI KK 22.08.77-JA-099567

J03 (14.03.79) C02c-05/12

Organic matter-contg. domestic waste water is electrolysed so it can be reused as washing water for e.g. a flush toilet. The water is introduced into an electrolysing vessel equipped with Al cathodes and subject to electrolysis to remove suspended solids by coagulation flotation with Al^{3+} and H_2 generated at Al anodes. The water, sepd. from the coagulated flocs is then introduced into an electrolysing vessel filled with electroconductive granules, i.e. granular activated charcoal, to rapidly and effectively lower TOD by electrolytic oxidn.

The pH of the water is gradually lowered as the electrolysis proceeds, and so the decay of organic matter is accelerated.

The appts. comprises an Al electrolysing part and under it and sepd. by a wire net filter, an activated charcoal-filled electrolysing part. The top cell comprises an anode with Al pieces packed around an insol. electrode, a peripheral cathode and means for removing coagulated suspended matters. The lower cell comprises a centre anode, a peripheral cathode and granular activated charcoal between them. 22. 8. 77 as 099567 (6pp34).

Flash evapn. appts. comprises a housing formed by a central vapour housing disposed between opposed shells with a wall preventing communication between the shells through the vapour housing. A unitary liq. flash and separator device is disposed in each chamber defined by the wall in the housing. An apertured plate is disposed within each chamber and defines with each shell a flash chamber.

Heated solute-laden liq. is introduced into each flash chamber and the vapour moves upwardly through the aperture with some suspended droplets. A mesh is supported between vapour passages to provide a circuitous path and trap liq. droplets on the mesh. Hoods are provided within each flash chamber affixed to the outside of the plate and a conduit joins the chambers together for conducting relatively more conc. effluent through a liq. flash and separator device.

Used for the recovery of pure water from sea water or contaminated water. The appts. is compact and exposes both top and bottom water surfaces to evapn. in the flash device. The size of the mesh separator is reduced by interposing reversals of flow in order to separate water droplets from the vapour. 17. 2. 77 as 769695 (7pp1044)

Measurement of gas e.g. carbon di:oxide in liquids e.g. beer - by conductivity measurement using tube of membrane permeable to the gas with a chemically active liq. on the outside
DRESCHER H P 12.10.77-DT-745763
A89 E36 J04 R16 (19.04.79) G01n-27/04

Quantity of gas e.g. CO_2, H_2S, SO_2 or NH_3 in a liq. is measured by passing it through a tube section formed from a material permeable to the gas. The tube is surrounded by an annular passage in which a reagent flows with which the gas will react.

The liquid is fed through by metering pumps as in the reagent. Changes in compsn. of the reagent are measured by conductivity cells. The permeable tube is generally a flexible material e.g. -Si-rubber.

Used for measurement of sol. gas contacts in liquids. Avoids the use of a purge gas and allows continuous operation. 12.10.77 as 745763 (12pp1053).

KUNZ- ★ D16 31773B/17 ★DT 2746-314
Malt-house kiln - with worm conveyor above malt-floor for discharging, and another at higher level for charging
KUNZEL W MUHLENBAU 14.10.77-DT-746314
(19.04.79) C12c-01/10

A malthouse tank, for use in steeping, germinating or kiln drying of barley, is fitted with a worm conveyor which remains through the whole operation close above the maltfloor and is used exclusively for discharging the malt. This conveyor is not adjustable at right angles to the maltfloor.

This simplifies the malt discharge and saves the power required to lower a conveyor through the green malt. 14.10.77 as 746314 (22pp39).

UPJO ★ D16 31828B/17 ★DT 2841-361
Antibiotic CC-1065 - disinfectant, oil preserving agent and for protecting silk worms from infection from Bacillus subtilis, prepd. from Streptomyces zelensis
UPJOHN CO 17.10.77-US-842914
B04 C03 H07 (19.04.79) C07g-11 C12d-09/16

The antibiotic CC-1065, which is effective against gram positive and gram negative bacteria and against L1210, P388 and B16 cells in vivo in mice has the following characteristics, in its essentially pure form: (a) mol. wt. ca 700; (b) C 61.06%; H 4.92%; N 13.17%; (c) is soluble in DMSO, DMF, acetone, CH_2Cl_2, ethylacetate and dioxan; and (d) in the form of a slurry in mineral oil, has a characteristic IR, nmr and proton spectrum as shown in the specification.

The antibiotic is suitable for use as an oil preserving agent to inhibit the bacteria which cause oil impurities. The antibiotic can also be used as a component of washing solns. for sanitary purposes. Because the antibiotic is also effective against Bacillus subtilis, it can also be used in the breeding places of silkworms to reduce infections caused by this bacterium.

The antibiotic is prepd. by culturing Streptomyces zelensis DSM 1341 (nov. sp.) in an aq. culture medium and under aerobic conditions. 22.9.78 as 841361 (30pp).

Prepn. of L-carnitine - by treatment of 3-dehydro:carnitine with carnitine dehydrogenase, a coenzyme, and a reducing agent
INST FRANCAIS DU PETROLE 18.07.77-FR-022183
B05 E16 (23.03.79) C07c-101/30

L-Carnitine $(CH_3)_3N^{+}CH_2CHOH\text{-}COO$ (I) is prepd. from 3-dehydrocarnitine $(CH_3)_3N^{+}CH_2COCOO^{-}$ (II) or one of its salts according to the following reaction, by simultaneous treatment, in an aq. medium, with (a) carnitine dehydrogenase, (b) a coenzyme which is used by the carnitine dehydrogenase for the reduction of dehydrocarnitine and (c) a reducing agent for the coenzyme.

The carnitine dehydrogenase may be isolated from Pseudomonas cultures, esp. P. fluorescens. The coenzyme is pref. nicotinamide adenine dinucleotide in oxidised or reduced form. The reducing agent may be chemical, such as an alkali metal dithionite or hydrogen and a noble metal catalyst, or it may be enzymic such as glucose/glucose dehydrogenase, a formate/formate dehydrogenase or ethanol)alcohol dehydrogenase.

Normal methods of synthesising carnitine give a racemic mixt. The biological activity is present only in the L-isomer. 18.7.77 as 022183 (12pp520).

De:chromone-carcinostatin - prepd. by culturing Streptomyces carcinostaticus

ZH BISEIBUTSU KAGAKU KEN (KANF) 25.08.77-JA-102324
B04 (16.03.79) A61k-37/02 C07g-11 C12d-09/14 C12d-13/06

An antibiotic, dechromoneocarzinostatin, is a white powdery substance active against Staphylococcus aureus, Bacillus subtilis, Sarcina lutea, Micrococcus fulvus, Ehrlich ascites tumour in mice, sarcoma 180 ascites-type in mice and leukemia L1210 in mice. It is soluble in water, but insol. in organic solvents. The UV spectrum determined in water shows an absorption max. at 280mμ, an absorption min. at 251mμ and a shoulder at 290-292 mμ and has IR absorption maxima at 3300, 1650 and 1540 cm^{-1}.

It is decomposed gradually and carbonised ay 260°C and has an isoelectric point at pH 3.3. The elementary analysis gives C 48.53, H 6.72; N 14.98; S 1.71; O 12.00. Aminoacids detectable upon hydrolysis are aspartic acid, threonine, serine, glutamic acid, proline, glycine, alanine, cystine, valine, isoleucine, leucine, tyrosine, phenylalanine, lysine, arginine and tryptophane. Antibacterial activity is preserved upon treatment with trypsin, chymotrypsin and pronase and it is stable at pH 3.5-7.

In an example, in a nutrient medium (pH 7.0) contg. 3% glucose, 2% defatted soybean meal, 0.1% K_2HPO_4, 0.1% $MgSO_4$, 0.005% $FeSO_4$, 0.001% $ZnSO_4$, 0.001% $CaCl_2$ and 0.05% silicone oil, Streptomyces carzinostaticus var. F-41 is cultured at 28°C for 3 days with stirring at 300rpm. under aeration of 18l/min. From 16l. of the cultured broth is obtd. a powdery substance, dechromoeocarzinostatin (205mg). 25. 8. 77 as 102324 (8pp16).

Acrylonitrile polymer fibre adsorbent - used to adsorb protein from aq. soln.

MITSUBISHI RAYON KK 24.08.77-JA-101403
A97 F01 J01 (A14) (16.03.79) C07g-07

The fibrous material adsorbent, is composed of acrylonitrile type polymer whose average single fibre fineness is ≯0.5 denier. The fibrous material has smallfineness compared with prior art synthetic fibre, thus the surface area of a given wt. of the assembled material is larger than that of conventional synthetic fibre, which increases the adsorption capacity, say, 10 times c.f. use of urokinase.

Desorption or elution of adsorbed protein can be easily effected using weak alkaline aq. soln. 24. 8. 77 as 101403 (4pp75).

CELLCO INC (CEL -) 18.05.72-US-254678
*(30.03.79) *NL7306-659 C12k-09*

Process for growing cells in vitro uses a capillary mounted in a chamber, the capillary having a wall which is permeable to nutrients necessary to cell growth, passing a nutrient medium through the capillary while the chamber contains a living cell culture, and allowing cells to settle on the capillary.

Generally the capillary unit consists of several parallel capillaries e.g. hollow cellulose acetate filaments, mounted e.g. in a glass tube and sealed with epoxy resin and caps. Nutrient medium is circulated through the capillary while the cell culture in the chamber remains in the stationary phase. Cells deposit on the capillaries and cell prodts. such as lactic acid and hormones pass into the nutrient stream from which they can later be recovered. 18.5.73 as 056252 (clg. 18.4.72-US-254678) C12k-9/00 (30.3.79) CELLCO INC (7pp) (J4 9041579)

Microorganisms culture unit - has partitions with parallel horizonta tubes connected to heat carrier headers
BELORUSS KIROV TECHN INS 07.05.76-SU-357686
(12.05.78) C12b-01/10

The improved foam breaking and enhanced mass exchange in the unit for microorganisms culture are due to partition The latter are in the form of parallel horizontal tubes connected to a common header for the flow of heat carrier. The sections are linked by overflow pipes whose lower end is fitted in the pocket of the partition having a weir.

The nutrient is fed onto the top partition, and then overflows to the lower partitions. The air moves upwards through the clearance between the horizontal tubes, and the nutrient is saturated with oxygen above the partitions. The produced foam is raised to the swirler where it is broken up by impacting the deflector. The fluid flows down while air is exhausted upwards.

Electrophoretic sepn. of enzymes and peptide(s) - on polyacrylamide gel using two sets of shaped electrodes

WEINTRAUB M 11.02.76-US-657232

A89 B04 J04 R16 (10.04.79) G01n-27/26

Electrophoretic purificn. of enzymes and peptides on polyacrylamide gel is improved by using divergent located shaped electrodes to provide separate vertical and horizontal fields. These fields are operated intermittently; the vertical electrical field separates the enzymes etc. according to mobility, and the horizontal field causes them to move horizontally.

Pref. the 2 fields are switched automatically to maintain a defined electrical field distribution and gradient along the width of the gel.

High level of purificn. and suitable for large scale use. There is no flow of buffer through the gel and the modular system of electrodes used makes the system of electrodes used makes the system very flexible. 11.2.76 as 657232 (13pp1251)

/S: N(BR, DT, GB, JA, SU, US) + E(FR).

ecovery of organic gases from formations contg.
rganic material (earth strata, bedrock or lake sedi-
nents) is carried out by (a) adding to water micro-
rganisms capable of fermenting the organic material
nd/or growth promoters for such microorganisms;
b) pumping the treated water into the formation through
ne or more conduits (wells, pipes, drain pipes, radial
screen pipes and/or ditches); (c) pumping water contg. organic gases in gaseous and/or dissolved form out of the formation through one or more conduits located at a suitable distance from the injection conduits; and (d) reducing the pressure of the water in a separating chamber to a pressure below that in the formation to release the gases.

The process is esp. useful for producing methane, e.g. from oil shale formations, swamps, marshes, coal deposits and oil or gas deposits. It can be applied to formations with a low content of organic material and does not significantly harm the environment.

10.10.78. as SW0058 (14pp357).

Sugar-beet juice sulphitation unit - has cyclone separator and perforated sulphur di:oxide and liquid mixing disc perpendicular to tube axis
UKR PROVISION MACH 06.01.77-SU-441283
(20.05.78) C13d-03/10

The unit is simplified due to the separator connected to the mixer of sulphur dioxide gas with liquid.

The mixer has a tube with a nozzle and a connector for feeding the sulphur dioxide gas. The nozzle is in the form of a perforated disc fitted at right angles to the tube axis, while the separator is of the cyclone type.

The fluid for sulphurisation is fed under pressure towards the disc from which it flows in the shape of jets that break up as droplets. The ejector effect of the jets draws the sulphur dioxide gas resulting in a two-phase flow ensuring intensive sulphurisation. The gas-liquid stream reaches the inner wall of the cylinder forming a turbulised fluid film with gas bubbles where the sulphurisation is completed.

Central Patents Index
NEWSLETTER

14th June 1979.

1979 No. 10

* 1. INSTRUCTION CLASSES

Subscribers are reminded that the deadline for return of forms for the forthcoming instruction classes was 31st May. Replies are now being analysed and any subscribers still considering their training requirements should contact Derwent immediately, preferably by telex, to ensure inclusion in the schedule.

* 2. COUNTRY ALERTING BULLETINS

With effect from Week B16 the following countries CA, CH, DL, RD and SW will appear under the heading "Other Countries" in alphabetical sequence with the Minor Countries at the end of the Alerting Bulletins.

* 3. BIBLIOGRAPHIC PRINT TAPES

The last batch of print tapes, containing data up to Week A51, and issued in February 1979, included a number of duplicate records. This problem affected all sections.

Production of the current quarterly tapes (data to Week B13) is being delayed for another week or two, to enable the existing data to be cleaned up, and to ensure that the problem does not recur in the future.

* 4. SECTION B (FARMDOC) PUNCH CODE SEARCH TAPES

It has been discovered by our computer bureau that due to a technical fault the tapes despatched on 27th April 1979 which should have contained data up to and including Week A51 inadvertently only contained data up to Week A39. We apologise for this and corrected replacement tapes will be despatched within the next week.

5. MANUAL CODES PRINTABLE ONLINE

Basic references added to the file from B08 onwards have all their Manual Codes added to the print file in line MC, which prints out in Standard Format PRT 0P4.

6. USE OF LINK/AND ONLINE

The attention of users is drawn to page 9 of the Supplement to the February 1979 SDC Newsletter in which it states that the two

repeated shampooing
not cause mutation of certain Salmonella typhimurium
29.12.77 as 758735 (23pp200).

agents, e.g. trisodium ethane 1-hydroxy-1,1 diphosphonate. 22.6.76 as 025841. (8pp931)

operators AND and LINK should never be used together in the same search statement.

This is an important point that users may have overlooked.

* 7. MANUAL CODE/COMPANY/CLASSES TAPE (Item 20)

Subscribers to this product should note that the file updated to B13, which has been despatched recently, contains Section N (Catalysis) Manual Codes and their relevant Accession Number postings for Week B01-B13 and future updates will continue to include such data.

8. SDC ONLINE FILE POSITION

WPI	SDC has updated to	Update code
Bibliographies	B13	7903
Manual Codes	B11	7903
Multipunch A+ Key Terms	A51	7813
Multipunch BCE	B03	7901

* 9. MULTIPUNCH SEARCHING UNDER SEVERAL SUBHEADINGS ONLINE

There appear to be problems when the procedures as outlined in Item 10 of the last Newsletter are adopted. Indeed, the simple search given has yielded incorrect answers.

Users should avoid the approach until we have clearly defined with SDC what the limitations are, and what anomalies remain to be corrected.

We hope to be able to report on progress in the next Newsletter.

* 10. RING INDEX TYPE NUMBERS IN 90,000 SERIES

Due to major changes now planned for 1980, we would like to remind subscribers that the use of the above numbers (for coding chemical fragments), which was announced in Instruction Manual No. 5A (February 1978) as commencing at CPI Week A01, was never implemented, and these numbers should not be included in multipunch searches.

* 11. HINTS ON ONLINE SEARCHING

(a) Searching for Japan as a patent country

When carrying out a search for all Japanese patents on a particular subject or in the name of a particular patentee, the use of the search term "ALL J#/PA" results in a "permanent postings overflow" message even when combined with another search term.

This type of search should be carried out by combining the subject parameter with each of the possible country codes. This is illustrated by the following search for all Japanese patents having WINDSCREEN as a title term.

```
RNM  AND TO +; RNM OR TO .
SS 1  WINDSCREEN/TT
SS 2  /PA 1+J5.1+J4.1+J7.1+JA
```

An alternative method (see item (b)), where the number of postings in SS 1 is low, is to stringsearch for :J: in the FM line.

(b) Searching for a patent country together with another parameter

When searching for all patents from a given country (e.g. USA) together with another parameter, such as a patentee code (e.g. BRAX for British Aircraft Corporation), a direct search (US/PA AND BRAX/PC) could give 5 to 6 time slices due to high postings for US/PA. An alternative method, involving stringsearching the FM line, is illustrated below:-

```
SS 1  BRAX/PC
    PSTG  (138)
SS 2  STRS/FM :US:
```

This method does, of course, become uneconomic if the number of postings for SS 1 exceeds about 250.

(c) Searching for "Standard Thesaurus Terms" containing "="symbol

Because the use of "=" symbol only became effective from CPI Week A04, complete retrieval on this type of term can only be achieved by additionally ANDing together the two words linked by "=" for the period up to Week A04. For example, a search for the word KNOCK=DOWN should be carried out as follows:-

```
SS 1  KNOCK=DOWN/TT
SS 2  /TT KNOCK AND DOWN AND NOT 79/AY
```

The first few answers for SS 2, relating to the period CPI Weeks A01 to A51 may be eliminated by the use of the SKIP technique.

---

not cause mutation of certain Salmonella typhimurium
29.12.77 as 758735 (23pp200).

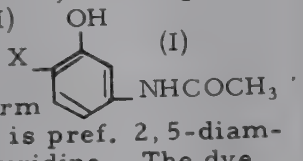
Fatty compn. for lipstick and eye shadow - contg. a fat mixed with a comparable homopolymer
L'OREAL SA 08.06.73-LU-067773
*A96 (A14) (19.04.79) *BE-815-976 A61k-07*

A solid or pasty cosmetic, e.g. rouge, lipstick or mascara, contains at least one fat and at least on nontoxic homopolymer taken from the gp. of homopolymers of vinyl esters of 7-20C satd. linear or branched monocarboxylic acids and homopolymers of acrylic or methacrylic esters of 11-21C satd. linear or branched monocarboxylic acids.

The homopolymers have a molecular wt. between 2000 and 500000. 7.6.74 as 427487 (9pp068)

OREA D21 01983W/02 =DS 2429-967
Hair dye compn contg. para phenylene diamine - with a halo-substd meta amino phenol coupling agent
L'OREAL SA 22.06.73-LU-067861
*E24 (19.04.79) *BE-816-675 A61k-07/13*

Hair dye contains (a) a known oxidation base which is ≥ 1 cpd. contg. two amino gps. or an amino and a hydroxy gp. in para-position on the benzene or heterocyclic ring and (b) as coupler ≥ 1 cpd. of the formula(I) (where X is F, Cl or Br), e.g. 2-chloro- 5-acetylaminophenol.



(I)

The oxidation base may be in the form of the free base or acid addn. salt and is pref. 2,5-diamino-pyridine or 2-hydroxy- 5-amino-pyridine. The dye gives a blonde or light brown colour. 21.6.74 as 429967 (8pp068)

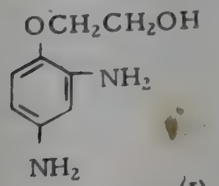
DEGS ★ D21 31791B/17 ★DT 2746-525
Yellow dental gold alloy for fusing to porcelain - also contains zinc, platinum, opt. palladium, rhodium, tantalum and/or tungsten
DEUTSCHE GOLD & SILBER 17.10.77-DT-746525
M26 (19.04.79) C22c-05/02

An alloy for supporting fused-on porcelain in dentistry contains, by wt., 0.3-2 % Zn in addn. to 60-90 % Au, 5-35 % Pt, 0-10 % Pd, 0.5-3 % Rh, 0.1-2 % Ta and/or W. Wt. ratio sum Pt metals : Zn : Ta and/or W is (15-30) : 1 : (0.5-1.3) pref. 25 : 1 : 1.

The alloys are also used as casting alloys for dental inlays, crowns and bridges, etc. in combination with plastics. Zn addn. prevents Ta and W oxidn. in re-casting. The alloys have a saturated golden shade exceeding that of Cu-contg. Au-Pt alloys and resisting several re-melting and casting processes. 17.10.77 as 746525 (8pp200).

BRIM ★ D21 31809B/17 ★DT 2758-735
Oxidn. dye compsn. for hair - contains aq. carrier, 1-hydroxy:ethoxy-2,4 di:aminobenzene, or salt, and a para-component
BRISTOL MYERS CO 06.10.77-US-839871
E14 (19.04.79) A61k-07/13

New 1-hydroxyethoxy-2,4-diaminobenzene having formula (I), or esp. its non-toxic salts, is used together with a p-component (II) in oxidn. dye compsns. for dyeing keratinous fibres. The compsns. contain a carrier and a colour-active quantity of (I) and (II), pref. 0.001-3 wt.% (I), or salt thereof, and 0.001-5 wt.% (II) capable of reacting on fibres in the presence of an oxidising agent, to form a coloured dyestuff.



(I)

The compsns. are used partic. for dyeing human hair, on head or as wigs. Shades obtd. are permanent and resist repeated shampooing with min. change in colour. (I) do not cause mutation of certain Salmonella typhimurium 29.12.77 as 758735 (23pp200).

ALKU ★ D21 31945B/17 ★EP ---1-471
Natural beeswax substitute compsn. - obtd. from a difunctional aliphatic acid, aliphatic alcohol and glycol
AKZO NV 11.10.77-US-841261
A25 (A96 D23) (18.04.79) C07c-69/34
D/S: E(BE, DT, FR, GB, NL).

A natural beeswax substitute is obtd. by reacting, under esterification conditions, (A) a 7-36C difunctional aliphatic acid, (B) a 10-22C aliphatic alcohol and (C) ethylene glycol, propylene glycol, polyoxyethylene glycol of mol. wt. 100-1500 or polyoxy-propylene glycol of mol. wt. 150-1025 in amts. such that the numbers of acid and OH functionalities are approx. equal, (B) and (C) each supplying ≥10% the OH functionalities, until the mixt. has acid value 10-30.

Alternatively, the reaction can be effected until the mixt. has acid value 0-30 and the prod. (I) mixed with a prod. (II) obtd. by reacting, under esterification conditions (a) 2 moles of a 10-30C aliphatic alcohol and 1 mole of a 7-36C difunctional aliphatic acid or (b) a 12-30C aliphatic acid and a 32-36C branched chain alcohol until the mixt. has acid value 0-30. (I) and (II) are in the wt. ratio 1:2-2:1 and the mixt. has acid value 5-30 for (a) or 10-30 for (b).

The substitute is useful in cosmetic formulations.

10.10.78 as 200235 (17pp558).
(E) ISR: US3912642; US2805247; GB854673.

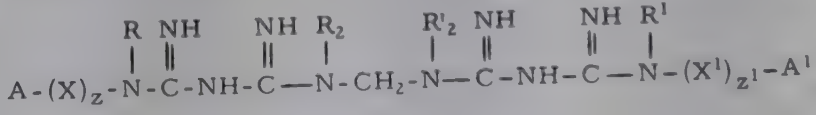
MINN D21 57996Y/33 =GB 1544-776
Highly pressure-resistant dental material prepn. - by polymerising mixt. of finely divided inorganic filler, polymerisable liq. organic binder and initiator
MINNESOTA MINING CO 09.02.76-US-656522
*A96 (25.04.79) *DT2705-220 +C08k-07*

Composite dental restorative material is prepd. by mixing and polymerising a liq. organic binder and a finely divided particulate filler having 70-95wt.% of its particles of size 0.7-25μ and 5-30wt.% of its particles of size 0.2-0.7μ. Pref. the binder comprises a glycidyl methacrylate deriv. of Bisphenol A and it may contain a reactive diluent. The filter is esp. α-quartz.

The materials show high compressive strength without loss of desirable translucency. 8.2.77 as 005168. (6pp945)

PROC D21 03257Y/02 =GB 1544-977
Bis biguanides for use in compsns. for tooth care - preventing formation of scale on teeth and avoiding discolouration
PROCTER & GAMBLE CO 24.03.76-US-670518 (23.06.75-US-589232)
*B05 E14 (25.04.79) *NL7606-824 A61k-07/22 A61k-31/15 C07c-129/16*

Bis-biguanide cpds. of formula (I) are new, where A and A^1 are each a substd. Ph contg. halogen, nitro, hydroxy or 1-6C alkyl or alkoxy substits.; X and X^1 are each 1-3C alkylene; z and z^1 are 0 or 1; R and R^1 are H, 1-12C alkyl and 7-12C aralkyl; R_2 and R'_2 are H, and 1-2C alkyl.



$$A-(X)_z-\overset{R}{N}-\overset{NH}{\overset{\|}{C}}-NH-\overset{NH}{\overset{\|}{C}}-\overset{R_2}{N}-CH_2-\overset{R'_2}{N}-\overset{NH}{\overset{\|}{C}}-NH-\overset{NH}{\overset{\|}{C}}-\overset{R^1}{N}-(X^1)_{z^1}-A^1$$

(I)

Pref. (I) is used in an oral compsn. contg. 0.01-2.5wt.% of (I); in a dentifrice, contg. 0.5-95wt.% dentifrice abrasive and 0.1-2wt.% of (I) used as an antiplaque agent; (I) is also used in mouthwash, chewing gum and lozenge compsns. The oral compsn. may contain anticaries agents, e.g. water-soluble fluoride, and anticalculus agents, e.g. trisodium ethane 1-hydroxy-1,1 diphosphonate. 22.6.76 as 025841. (8pp931)

PROC D21 03257Y/02 =GB 1544-978

Bis biguanides for use in compsns. for tooth care - preventing formation of scale on teeth and avoiding discolouration

PROCTER & GAMBLE CO 24.03.76-US-670518 (23.06.75-US-589232)

*B05 E14 (25.04.79) *NL7606-824 A61k-07/22 A61k-31/15*

Oral compsn. comprises a carrier for use in the oral cavity and 0.01-2.5% bis-biguanide anti-plaque agent of formula A-$(X)_z$-N(R)-C(=NH)-NH-C(=NH)-N(R_2)-$(CH_2)_n$-N(R'_2)-C(=NH)-NH-C(=NH)-N-(R^1)-$(X^1)_{z^1}$-A^1 (I) where A and A^1 are each substd. Ph contg. halogen, nitro, hydroxy or 1-6C alkyl or alkoxy substits.; X and X^1 are each 1-3C alkylene; z and z^1 are 0 or 1; R and R^1 are H, 1-12C alkyl and 7-12C aralkyl; R_2 and R'_2 are H, 1-2C alkyl; and n is 2-4. Pharmaceutically acceptable salts of (I) are also prepd.

(I) is used in the form of a dentifrice contg. 0.5-95% dentifrice abrasive and 0.1-2% (I), a mouthwash, chewing gum or lozenge. Compsns. are esp. used to inhibit formation of plaque and caries. 22.6.76 as 33381/78, Div. ex 1544977. (9pp931)

NIOF ★ D21 32353B/17 ★J5 4035-221

Cosmetic compsn. - contains a polypropylene oxide cpd. to provide water holding and emulsifying property

NIPPON OILS & FATS KK 24.08.77-JA-100637

A96 (A25) (15.03.79) A61k-07

The cosmetic compsn. contains the cpd. R-O-$(C_3H_6O)_aX$ (I) (where R is 12-22C alkyl, alkenyl; X is 8-18C branched fatty acid gp. a = 10-25.

(I) which can be prepd. by adding propyleneoxide to higher alcohol and esterifying the adduct with branched fatty acid does not corrode celluloid, shows emulsifying property and water-holding property, gives light touch to skin and is stable and hardly hydrolysed. 24.8.77 as 100637 (4pp).

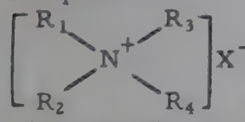
LIOY ★ D21 32354B/17 ★J5 4035-222

Hair rinsing compsn. - contg. quat. ammonium salt and water-soluble polymer(s) as essential components

LION FAT & OIL KK 26.07.77-JA-089520

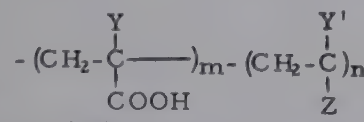
A96 (15.03.79) A61k-07/08

Objective hair rinsing compsn. contains 0.5-5 w/w% of quaternary ammonium salt (I) and 0.1-2 w/w% of water soluble polymer (II) and/or polymer (III) as the essential components.



(I)

$[R_1R_2N^+R_3R_4]X^-$



(II)

$-(CH_2-C(Y)(COOH))_m-(CH_2-C(Y')(Z))_n-$

-$(CH_2CH_2O)_p$-CH_2CH_2OH (IV).

In the formulae, R_1 is 8-12C (hydroxy)alkyl; R_2 is 1-22C (hydroxy)alkyl or benzyl; R_3, R_4 are each 1-4C alkyl gp. or the gp. (IV) of which p is 0-5 in average. X is monovalent anion originated from quaternising agent. Y, Y' is each H or methyl. Z is OH, acetyloxy gp., carbamoyl gp. or propionoyloxy gp.; and m/n is 10/0-3/1.

The mol. wt. of the polymer (II) is 10000-600000. The polymer (III) is a water soluble polymer of mole wt. 10000-600000 which is composed of 90 w/w% of the monomer unit structuring the polymer (II) and 10 w/w% of other polymerisable monomer unit.

The compsn. can give better rinsing effect in oily feeling, combing property and pliability than conventional hair rinsing compsns. and excellent finishing effect can be attained. It is stable in wide pH range even at low temp. 26.7.77 as 089520 (9pp5).

NAKA/ ★ D21 32355B/17 ★J5 4035-223

Hair growing agent - contg. mixt. of Laminariales and Cyanophyta or Chlorophyta extracts as effective ingredients

NAKAZAWA T 25.08.77-JA-102045

(15.03.79) A61k-07/06

The hair tonic contains a homogeneous mixt. of the extract of Laminariales and the extract of Cyanophyta (e.g. Spirulina) or Chlorophyta (e.g. Chlorella) as the effective ingredient.

The extracts show synergic hair-growing effect, that is, it is effective to prevent the falling-off of hair and the formation of dandruff and to make hair glossy and pliable. The prod. is combined at ca. 10% in hair-treatment, shampoo, hair rinse, hair tonic, hair cream, pommade, etc. 25.8.77 as 102045 (2pp5).

MORI/ ★ D21 32518B/17 ★J5 4036-3

Dandruff and urticaria preventative shampoo prodn. - by blendi rice bran ferulate with soap or slightly acidic synthetic cleaner

MORITA S 25.08.77-JA-102437

A96 (17.03.79) A61k-07/06 C11d-09/26

Dandruff and urtication preventive shampoo is prepd. b the blending 0.01-1.0(0.05-0.1)wt.% of rice bran ferula (i.e. oryzanol) to the base material of soap or slightly acidic synthetic cleaner. The soap is Na or K salt of fat acid, and the synthetic cleaner is e.g. N-acyl-L-sodiu glutamate.

Harmless dandruff and urtication preventive hair sha poo is prepd. using secondary prod. of rice oil, i.e. mixt. of steroid and ferulate ester of triterpene alcohol 25.8.77 as 102437 (3pp170).

SHIS D21 30997X/17 =J7 9006-

Odourless, stable, permanent wave compsn - contg an ethylene propylene carbonate as accelerator

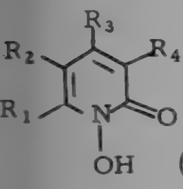
1-hydroxy-2-pyridones of formula (I) and/or their salts are used as anti-dandruff agents. In the formula, R_1 is H, 1-17C alkyl, 2-17C alkenyl, 5-8C cycloalkyl, cycloalkyl-(1-4C alkyl) in which the cycloalkyl group can be substd. by 1-4C alkyl, aryl, aryl-(1-4C alkyl), aryl-(2-4C alkenyl), aryloxy-(1-4C alkyl), aryl-thio-(1-4C alkyl), benzhydryl, phenyl-sulphonyl-(1-4C alkyl), furyl or furyl-(2-4C alkenyl), the aryl residues opt. being substd. by 1-4C alkyl, 1-4C alkoxy, NO_2, CN or halogen; R_2 is H, 1-4C alkyl, 2-4C alkenyl or alkynyl, halogen or benzyl; R_3 is H, 1-4C alkyl or phenyl; and R_4 is H, 1-4C alkyl, 2-4C alkenyl, methoxymethyl, halogen or benzyl. (I) are easy to incorporate into various cosmetic preparations on account of their good solubility and stability properties.



(I)

Pref. formulations contg. (I) are shampoos, although other formulations such as aqueous-alcoholic solns. hair fixatives, hair oil, hair pomades, brilliantine etc. are also possible. The amount of (I) in these formulations is generally 0.05-10%, although larger amounts may be present in formulations in conc. form.

FARB ★ D22 31932B/17 ★EP ---1-438

Burning transiently explosive gases without back-firing - by feeding the gases into a quiescent annular chamber before discharging into combustion chamber with vortex flow

BAYER AG 10.10.77-DT-745493
J09 Q51 Q73 (18.04.79) B01d-53/34 F01n-03/10 F23d-13 F23g-07/06
D/S: E(BE,CH,DT,FR,GB,NL).

Transiently explosive gases or gas mixtures are burnt without danger of back-firing by feeding the gases before their entry into a combustion chamber into a quiescent annular chamber in which the gas flow velocity is greater than the max. possible flame propagation velocity, inducing a vortex in the gas flow. The vortex which is coaxial [illegible] and the combustion chamber is of the hyper critical type so that a radially outer, axially forward and a radially inner axially rearward flow is induced. If required, auxiliary fuel or air may be supplied.

Combustion chamber is compact due to reduced air requirement.

29.9.78 as 101029 (31pp536).
(G) ISR: DS-232500, DT2434960, FR2366517, DT2317513, GB1465310, US2581075, FR1409309.

POPU- ★ D22 31938B/17 ★EP ---1-452

Ampoule for long term storage of polymerisable substances - the ampoule and stoppers for it being made of a material which does not induce polymerisation

POPULATION RES INC 11.10.77-US-840903
A96 E16 P33 Q32 (A14 A17 A35) (18.04.79) A61j-01/06 B65d-35/30
D/S E(BE, CH, DT, FR, GB, LU, NL, SW).

A polymerisable material, such as a monomer of methyl cyanoacrylate useful as a tissue adhesive, is stored in an ampoule comprising a hollow body (12) closed at one end by a stopper (32) covered by a material (36) pref. PTFE which does not induce polymerisation, and closed at the other end by a piston (50) having a flared inner end (64) and having an external sealing ring (62) pref. of a high modulus rubber e.g. butyl, natural, buna. A space (80) is defined between the body wall. The sealing ring, and the flared end of the piston. The piston and body are made of a material such as polyethylene, which will not induce polymerisation.

In use, to disperse the material, the stopper is pierced by a hypodermic needle (42) and the piston pushed into the body to force the material into a syringe (40).

The choice of material for the body, the stopper and the piston helps prevent polymerisation, and increases shelf life. The space (80) contains any material leading past the piston and prevents it from contaminating the material remaining in the body.

Oxidised cellulose prods. useful as haemostatic agents - prepd. by treating cellulose with nitric acid contg. phlegmatised alkali nitrite catalyst

STATNI VU TEXTILNI 03.10.75-CS-006704 (07.10.77-NL-011034)

A11 P34 (A96) (10.04 79) A61l-15 C08b-15

The process comprises treating wood- or cotton cellulose
with an oxidn. liquor contg. nitric acid in the presence of
a phlegmatised alkali nitrite as catalyst. The oxidised cel
lulose is then stabilised and/or converted into the Ca-,
Na- or NH_4 salt. The prod. is then dewatered, dried or op
impregnated or otherwise treated. The resulting oxidised
cellulose material, made by nitro-oxidative treatment for
20-30 hrs., is then subjected to a radiation dose of at mo
10^5 J.kg.$^{-1}$

The resulting oxidised cellulose has improved stability
at room temp. than prior art oxidised cellulose prods.
Prods. are esp. useful in medical applications for stoppin
bleeding, e.g. of wounds or during operations. The material has a good haemostatic effect and adhesion to tissue
and is rapidly absorbed by the tissue so that irritation of
the tissue is avoided. The prods. may be e.g. in the for
of gauze, non-woven fabrics, knitted fabrics etc. 7.10.7

Fatty acids saponification control - with reagent feed rate controlled by monitoring viscosity stabilisation level
KALASHNIK A I 23.06.76-SU-374566
E17 R26 (12.05.78) C10c-01 G05d-27

The accurate control of complete saponification in the production of plastic lubricants is ensured by feeding fatty acids and the saponifying agent into the reactor. The mixt. is circulated at a rate depending on the viscosity of the reaction mass, and when the viscosity is stabilised its value is compared with the set level.

The deviation of the viscosity from the set value is used for adjusting the ratio of fatty acids and saponifying agent feeds to the reactor, while the rate of circulation is maintained at the level reached when the viscosity stabilisation was attained.

Kalashnik, A.I., Manoilo, A.M., Shkaraputa, L.N. et al. Bul. 22/15.6.78. 23.6.76. as 374566 (3pp89)

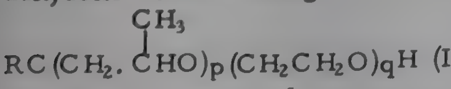
Solid, water-contg. raw materials which release water below their m.pt. are exposed, in a granulator, to sufficient heat to release water. The raw materials granulated may be (1) water-contg. alkali silicates, esp. alkali metasilicates contg. 5-9 mol H_2O, e.g. alkali metasilicate + 5 mol H_2O (water-release at 60°C) and alkali metasilicate + 9 mol H_2O (water-release below 40°C); (2) water-contg. phosphates, esp. alkali triphosphate + 6 mol H_2O; (3) mixts. contg. 1 water-contg. component e.g. $Na_2SO_4.10\ H_2O$ or $Na_2CO_3.10\ H_2O$; (4) mixts. of a water-contg. alkali silicate with anhydrous alkali silicate and/or further water-contg. alkali silicate.

The granulates obtd. are pref. used in prepn. of detergent and cleansing compsns. The granulates are free-flowing, non-dusting, do not agglomerate, require no subsequent conditioning phase, form no dust on mixing with detergent and have a uniform grain-size. Active Cl-contg. materials may be added to mixt. before granulating. 5.10.77 as 744753 (16pp200).

LIOY ★ D25 32126B/17 ★J5 4034-306
Heavy-duty liquid detergent compsn. - comprises block polymer of polyoxyalkylene ether and alkyl:ether sulphate
LION FAT & OIL KK 23.08.77-JA-101464
A97 (A25) (13.03.79) C11d-01/83

The compsns. comprise (a) a block polymer of polyoxyalkylene ether having formula (I):



$$RC(CH_2.\overset{\overset{\textstyle CH_3}{|}}{C}HO)_p(CH_2CH_2O)_qH \quad (I)$$

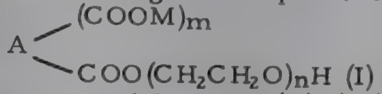
(where R is opt. branched alkyl and p and q are average addition moles of oxyalkylene and p is an integer of 1-3 and q is an integer of 5-15) and (b) an alkylether sulphate in a wt. ratio of component (a) to the component (b) ranging from 7/3-4/6.

In an example, detergent comprises 20 wt. % of $RO(C_3H_6O)_p(C_2H_4O)_qH$ (where R is a 9-11C alkyl, p is 1, 2 or 3 and q is 8 or 12), 20 wt. % of $C_{12-13}O(C_2H_4O)_3SO_3Na$, 10 wt. % of ethanol and 50 wt. % of water. The polyalkylenealkyl ethers have structures of block type and may be prepd. as addn. prods. of a starting alcohol with 1-3 moles of propylene oxide and then with 5-15 moles of ethylene oxide.

The compsns. show high washing powder, foaming property, tendency to be rinsed easily and low film foaming property. 23.8.77 as 101464 (5pp59).

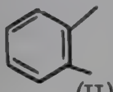
SHIV ★ D25 32127B/17 ★J5 4034-307
Non-pollutant detergent compsn. - contg. a polyoxyethylene deriv. surfactant prepd. e.g. from succinic anhydride and polyethylene glycol
NEW JAPAN CHEM 24.08.77-JA-101949
A97 (A25) (13.03.79) C11d-03/20

The detergent compsns. contain a cpd. of formula (I)

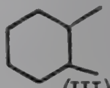


$$A\begin{cases}(COOM)_m\\ COO(CH_2CH_2O)_nH\end{cases} \quad (I)$$

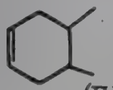
In (I) A is a divalent or trivalent residue of 1-3C alk(en)yl, opt. substd. by methyl or OH, or gp. of formula (II)-(IV):



(II)



(III)



(IV)

and m is an integer of 1 or 2, n is an integer of 2-150 and M is an alkali metal, ammonia or amine.

In an example, succinic anhydride is mixed with an equimolar portion of polyethylene glycol having a molecular wt. of 200 under agitation. The mixt. is reacted at <90°C. The temp. is then gradually increased to 130°C. The mixt. is maintained at 130°C until the system is changed into fully homogeneous state to obtain a monoester in stoichiometric yield. The monoester is aged at 130°C for 30 min. The cooled monoester is then added dropwise into an aq. caustic soda soln. while cooling the mixt. to obtain an aq. 50% soln. of Na succinic polyethylene monoester having saponification value of 78.7.

The compsns. are free from phosphate which causes pollution of waste water. 24.8.77 as 101949 (6pp59).

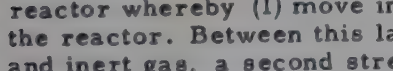
New dialkylaminoalkylterpenyl acetic acids are of formula (I):



$$R'-\underset{\displaystyle COOH}{CH}-(CH_2CH=\underset{\displaystyle CH_3}{C}-CH_2)_n-H \quad (I)$$

in which R' = an aliphatic group (II): $-CH_2-CH_2-CH_2-N(CH_3)_2$; n = 2 or 3.

(I) have antibacterial activity and may be used as antibacterially-active agents such as cleaning-, wetting-, foaming-, flotation agents, stabilising agents for emulsions and suspensions, disinfectants, and preservatives. (I) have strong hydrophilic-, and lipophilic properties.

Prepn. is e.g. by reacting a substd. malonic ester with an alkylhalide and saponifying and decarboxylating the ester formed. 27.10.71 as 014802 (5pp279)

Washing-up compsn - contg esters of phosphoric acid

HOECHST AG (KNAP) 04.09.71-DT-144425

*E11 (17.04.79) *DT2144-425 C11d-01/34*

Machine washing of dishes or glasses is effected using a washing up-brightening agent.

The agent used to polish the dishes and glasses is a soln. in water of one or more aliphatic mono- or diesters of aliphatic phosphoric acid, in which the alcohol component of the ester contains 1-8C., e.g. mono- and diisopropyl ester of phosphoric acid of density 1.4 as a soln., in 80 wt.% water. 29.8.72 as 011766 (3pp549)

*F06 (11.08.78) *SU-260-065 + C11d-01/14*

Washing compsn. for textiles contains a surfactant such as an alkylsulphonate and a protein hydrolysate (I). Addn. of (I) provides a compsn. having high dermophilic properties.

Industrial alkylsulphonate contains (in wt. %) alkylsulphonate 83.5-92, NaCl 6-8, hydrocarbons 1.0-1.5, moisture 0.5-1. The protein hydrolysate contains (in wt. %) peptides (mol. wt. 600-700) 38-45, 6, NaCl 0.1-0.4, CH_3COONa 1.4-2.0, water 52.6 - 59.5. The alkylsulphonate is introduced, with stirring, into the protein hydrolysate at 55-60°C over 30-40 min., the mixt. is then kept for 1hr. at 60-70°C. The resulting liquid, termed 'sulphoponate', contains (in wt. %) sodium alkylsulphonate 13-16, peptides 35-40, water 43-46. The surface tension of a 0.125% soln. is 28-30 dyne/cm. the detergency is 58-61% w.r.t. lauryl sulphate. This product is recommended for use as dyeing aid for acetate fabrics, and for washing of textiles dyed with diazotised dyes.

Volkov, Yu.M., Kulabukhova, T.S., Golubkov, S.V. et al. Bul. 3 (1970)/22.12.69. 19.10.68. as 279361 (2pp70)

CPI INDEXES

ALERTING PATENTEE INDEX (II)

Weekly by section and overall, lists all current patents in patentee code order and, within a given patentee, in earliest priority date order. The first line gives patentee code, earliest priority date, patentee name, CPI classes and finally the current patent number. The second line gives the first part of the title, followed by the accession number.

CPI CLASS INDEX (IV)

Weekly only. Headings are all the CPI classes within the section to which an Alerting Bulletin relates, arranged in numerical order. Posted under each class heading is a list, in country then patent number order, of all basic or equivalent documents referenced or cross-referenced under that heading.

BASIC NUMBER INDEX (V)

Weekly by section and overall, lists all entries by accession number. Each heading consists of the accession number in bold, followed by the CPI section letters. There then follows a list of all the family members, commencing with the basic and finishing with the current week's patent. For each family member the CPI week of issue is quoted, and a plus sign indicates that a multiple priority has been claimed.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

In Basic Abstracts Journal only

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry
A+	Polymer Applns.
AE	Polymer & General Chemistry
B	Pharmaceuticals
C	Agricultural Chemistry
D	Food, Disinfectants, Detergents
E	General Chemistry
E+	General Chemistry Applns.
F	Textiles, Paper, Cellulose
G	Printing, Coating, Photographic Chemistry
H	Petroleum
J	Chemical Engineering
K	Nucleonics, Explosives, Protection
L	Refractories, Ceramics
M	Metallurgy

Typical Abstract Heading

See CPI/WPI Instruction Manual No. 1A for explanation of the various flagged descriptors.

Copies of Specifications may be ordered from our PATENTS SUPPLY DIVISION.

EUROPEAN PATENTS REPORT
PCT PATENTS REPORT

New publications in the World Patents Abstracts service provide detailed, documentation-type abstracts, with drawings, of **all EPO and PCT** applications within **14 days** of publication. Also reported with the **designated states**, and references cited in the **international search report.**

Annual subscription costs :—
European Patents Report : £250, $525 or Y 95,000
PCT Patents Report : £100, $210 or Y 38,000

As support documentation the abstracts and complete specifications are available on **microfilm.**
Descriptive brochures giving complete price list, and specimen copies, are available on request from the Subscription Department.

D1: FOOD; FERMENTATION

D11 : BAKING

IPE- ★ D11 334048/18 ★BE-873-161
re-steaming hot air bread oven for industrial bakery - uses heat
ccumulator to produce steam for next batch
TIPE REVENT AB 28.12.78 BE-873161
(17.04.79) A21b

he oven is of the type in which hot air is passed in a clo-
ed circuit through the oven chamber and through a regen-
rative heat accumulator. Water is distributed on to the
eated accumulator to steam the loaves just before start-
ng the air circulation.
The accumulator now comprises a considerable number
f massive lumps or blocks of material of high thermal
onductivity, e.g. steel. The blocks are arranged in a
ertical plane which extends across the circulated air
urrent. The blocks are spaced and/or present inter-block
hannels so that the hot air can pass freely through.
Allows rapid steam prodn. in large quantities over a
hort period without using a separate boiler and without
mploying additional heat to that used in recirculated air.
The accumulator is inexpensive and raised the thermal
fficiency of the system. 28.12.78 as 873161 (12pp448)

Instant pasta prepn. with high liq. absorption capacity - by expanding gelatinised dough to form porous centre, cutting and drying
SOC PRODS NESTLE SA 25.10.77-US-844579
(26.04.79) A23l-01/16

Easily re-hydratable, so-called "instant" pasta is made by (i) preparing a layer out of a gelatinised cereal flour dough, (ii) expanding the dough under controlled conditions to impart a high degree of a uniformly porous structure to dough centre, (iii) dividing the expanded dough into pieces having the desired shape, thereby exposing the porous centre of the shaped pieces along their peripheral areas, and (iv) drying.

The pasta may consist of noodles, spaghetti, letters, etc., esp. for preparing instant noodle soups and casserole prods. The dried pieces are quickly re-constituted, e.g in <3 min. by adding boiling water, have high liq. absorption capacity and a high liq. absorption velocity. Their organoleptic properties correspond to those of standard pasta. 23.10.78 as 846045 (34pp200)

Prodn. of partially baked bread products - by partially baking dough pieces and sterilising in evacuated packages

JOULIN G 21.10.77-FR-031720

(02.05.79) A21d-13

Partially baked bread prods. are produced by (a) kneading a dough based on flour, water and yeast, shaping the dough into pieces, and allowing to ferment; (b) partially baking the dough pieces and stopping baking after structuration but before coloration; (c) placing the partially baked dough pieces under vacuum and degassing them; and (d) packaging the products and sterilising them by heat treatment while they are in their packages.

The prods. can be stored for several months, after which baking can be completed just before consumption to give bread with a fresh appearance, consistency and flavour; this is esp. useful in the case of 'French' bread, which normally gets stale rapidly. 3.10.78 as 039093 (5pp367)

Sweet, juicy roast chicken piece prodn. - by roasting in microwave oven, covering in batter and corn flakes and roasting in hot fat
SZCZESNY A 21.10.77-DT-747213
*(26.04.79) A23l-01/**

Roast spring-chicken (or poussin) prepn. comprises (a) dividing the chicken into sections, (b) roasting the sections in a microwave oven, pref. in 10-11 min. (c) surrounding with a batter of dough prepd. from flour, eggs, honey, milk, germ oil and spices, and adding partly crushed cornflakes, and (d) roasting the 'crumbed' pieces in a chip-pan, while swimming in hot fat, pref. in 3 min. at 175-190°C, until batter turns golden-brown.

Over-roasting may be effected in a place other than that for first microwave oven-roasting. Process is partic. suitable for restaurants, deep-frozen convenience foods or take-away foods. Loss of juices is prevented. The chicken pieces have a characteristic, sweetish, new attractive taste and a crunchy, attractive appearance. 21.10.77 as 747213 (10pp200)

Small fish processing method - using tailpiece from cross:cut near ventral cavity end for human consumption
MATCON RAADGIVENDE 19.10.77-DK-004651
(26.04.79) A22c-25/16

Small types of round fish, such as Gadus Poutassou, are processed by cutting the fish in two by a cross cut near rear of the ventral cavity. The tail end is processed for human consumption and the front end is turned into fishmeal and other industrial prods.

The processing machines are able to deal with the great masses of caught small fish without wasting parts which are fit for human consumption. The mechanical prepn. of the tailpiece is greatly facilitated and many manual operations are saved. The tailpiece can be filleted by two simple cuts. A higher yield can be obtd. by treating the tailpiece in a separator. Either process can be carried out on board a fishing vessel, including the cutting to fish fingers. 17.10.78 as 845208 (6pp39)

Prepn. of food prod. from mushroom stumps - by removing loose dirt, washing and forming a puree

CASTLE & COOKE INC 01.02.77-US-764703
*(D16) (02.05.79) *US4085-233 A23l-01/28 +A23n-13 A23n-15*

A useful food prod. is produced from a waste mushroom material contg. mushroom stumps. Prepn. comprises cleaning the dry material to remove loose dirt, washing the cleaned material under pressure to remove further dirt, breaking down the material to small particle size to form a puree, and removing the remaining dirt from the puree.

Pref. the puree is pasteurised, then concentrated. Cleaning step includes sending the material through a perforated or apertured drum rotating at 5-50 r.p.m., while dirt drops out through the drum.

Mushroom stumps are used in food prods. as flavourin agents in soup bases and in bauillon cubes, protein-flavou potentiators, dips, gravies, and pet foods. 20.9.77 as 039207 (5pp931)

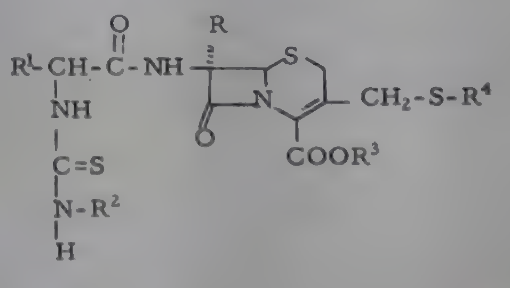
New 7-a-thioureido-acetamido-cephalosporins are of fo ula (I).



(I)

In the formula R is H or OCH_3. R^1 is H, lower alkyl cyclo-lower alk(en)yl, cyclo-lower alkadienyl, thienyl, furyl, phenyl-lower-alkyl or phenyl opt. substd. by hal gen, OH, NH_2, lower alkyl, or lower alkoxy. R^2 is H, lower alk(en)yl, cyclo-lower alkyl or lower alkanoyl. R^3 is H, lower alkyl, (di)phenyl-lower alkyl, tri(lower alkyl) silyl, a salt-forming ion, or $-CH(R^6)-O-CO-R^5$ (where R^5 is lower alkyl, phenyl or phenyl-lower alkyl, and R^6 is H or lower alkyl) R^4 is a 5- or 6-membered heterocyclic ring contg. C and 1-4 atoms selected from N, S and O opt. substd. with 1 lower alkyl, lower alkoxy, halogen or exocyclic O, provided that when R^4 is a 5-membered heterocyclic ring, the ring contains $\leq$ 4N atoms and/or $\leq$3 O or S atoms.

The new cpds. have a broad spectrum of antibacterial activity against both gram positive and gram negative organisms, and can also be used as nutritional supplements in animal feeds. 5.7.76 as 027897 (26pp990)

MITN ★ D13 33954B/18 ★J5 4037-088

Oxygen absorbent used in enclosed environment with moist food - comprises metal halide mixed with iron cpd. and opt. water

MITSUBISHI GAS CHEM IND 30.08.77-JA-103788

A92 E36 G04 (19.03.79) A23l-03/34 B01d-53/16

Agent consists of a mixt. of metal halide and cpd(s) from iron carbide, or carbonyl, and ferrous (hydr)oxide, opt. water is added to the mixt. Pref. the metal halide is fluoride, chloride, bromide, or iodide of Na, K, Mg, Ca, Ba, Fe, Al, Co, Ni, Sn, Zn, or Cu.

In an example, 4 g. iron carbide was mixed with 2 g. KCl and packed in a porous bag made of a polyethylene film to obtain an oxygen absorbing agent. The agent was set with 20 g. of bread in an enclosed vessel of 500 ml. of volume. After 24 hrs., oxygen concn. of the enclosed vessel was 4.2% and after 48 hrs. 0.01%. 30.8.77 as 103788 (5pp51)

KAOS ★ D13 34098B/18 ★J5 4037-843

Emulsifier prodn. for foodstuffs - by melting mixt. of sorbitol or sorbitan fatty acid mono:ester and glycerine and/or propylene glycol fatty acid ester, cooling etc.

KAO SOAP KK 26.08.77-JA-102452

E17 (20.03.79) A21d-02/16 A21d-13/08 A23l-01

2-30 wt.% Sorbitol (12-18C) fatty acid monoester having HLB of $\geq$10, the fatty acid or sorbitan (12-18C) fatty acid monoester having HLB of $\geq$10, and 98.70 wt.% of glycerine fatty acid ester, propylene glycol fatty acid ester or their mixt. are melted under heating, and cooled to solidify and crushed into powder or flake.

The agent can easily be dispersed into water, has no bad influence upon taste of foodstuffs and has high emulsifying ability. In an example, commercially available sorbitan monooleate is distilled to collect main fraction which has HLB of 10.8. 55 Grams of this fraction is mixed with 80 g. of glycerine stearate and heated at $\geq$70°C. and then cooled and crushed to give fine powder. 26.8.77 as 102452 (5pp22)

FUKO ★ D13 34099B/18 ★J5 4037-846

Frozen protein prepn. - by washing and neutralising acid-pptd. soybean protein curd, heating, cooling and freezing

FUJI OIL KK 29.08.77-JA-103886

(20.03.79) A23j-03 A23l-01/20

Acid-pptd. curd of soybean protein is washed with water, and neutralised, to give a prod. of solid content $\geq$15%. This is homogeneously heated at 70-160°C., followed by cooling and freezing to give frozen protein.

Prod. has high elasticity and whiteness and can be used as a substitute for minced fish meat in paste foodstuffs, such as Kamaboko, Chikuwa, etc.

In an example, defatted soybean was extracted with dilute aq. alkaline soln. to give protein a component, mixed with acid to give curd, which was then washed with water. The prod. was dried and neutralised to pH 7.0 and heated at 80°C. for 120 secs., followed by cooling to 55°C. and then freezing to -40°C. The prod. could be used as a substitute for minced fish meat after defrosting. 29.8.77 as 103886 (8pp22)

NIKO- ★ D13 34100B/18 ★J5 4037-847

Frozen bean curd prepn. - includes mixing devil's tongue with protective colloid and adding soya bean juice and coagulating agent

NIPPON KONNYAKU KYO (MIYA-) 30.08.77-JA-103826

(20.03.79) A23l-01/20

One wt. part of devil's tongue or its deriv. powder is mixed with a suitable amt. of protecting colloidal agent and water, followed by agitation, and the resulting protecting colloidal swelled soln. is mixed with 0.1-80 wt. pts. of soya-bean juice with addition of coagulating agent for devil's tongue and that for soya-bean juice at the same time or separately, followed by agitation, and the resultant is then boiled, shaped, cut, frozen, aged, de-frozen, dehydrated and dried, whereby there is obtd. frozen bean curd.

The curd has good taste, touch and appearance and contains high quantity of protein, and thus can be used as substitute for frozen bean curd prepd. only from soybean as an important vegetable protein source. The protecting colloidal agent and the coagulating agents may be conventional. 30.8.77 as 013826 (5pp22)

NAKA/ ★ D13 34101B/18 ★J5 4037-850

Alkaline refreshing drink with therapeutic properties - contains extracts of tangle and green sea weed or Myxophyceae, sweetening agent and organic acid

NAKAZAWA T 25.08.77-JA-102048

B04 (20.03.79) A23l-01/33 A23l-02/38

Extract of tangle is mixed with extract of green sea weed or Myxophyceae homogeneously, and the mixt. is further mixed with sweetening agent and organic acid.

For example, 4 g. of equivolume mixt. of tangle and Spirulina is extracted with 30 ml. of ethanol by keeping the mixt. standing for 50 hrs. with agitation 5-6 times during this period. The extract is subjected to filtration, and the filtrate is warmed on a water bath heated at 30-40°C. to evaporate ethanol. This soln. contains the active ingredients, and the soln. is then diluted with water 20 times as much volume. To the soln. are added sugar, citric acid and antiseptics. Thus obtd. compsn. has good taste and flavour and is effective for curing various kinds of illnesses. 25.8.77 as 102048 (2pp22)

NIOF ★ D13 34103B/18 ★J5 4037-858

Storage stable whipped cream prepn. - by mixing butter or oil with fat or oil higher m.pt. and adding a non-fat solid milk component

NIPPON OILS & FATS KK 31.08.77-JA-104407

(20.03.79) A23c-09 A23c-13 A23g-09

In prepn. of whipped cream using butter or oil as the fat source, butter or oil is mixed with fat or oil having m.pt. higher than that of the butter or oil, whereby the m.pt. is increased 2-5°C., and no-fat solid milk component is added so that the total content of non-fatty milk component in the compsn. is increased by 2-5 wt.%. The cream has good taste, good processability, good storage stability, etc.

In an example, 47 pts. of butter oil, 53 pts. of milk and 0.1 pt. of Na hexametaphosphate are blended with one another, and the compsn. is mixed with 0.7 pt. of soybean lecithin, and 0.8 pt. of sugar fatty acid ester, as emulsifiers, followed by heating at 70-75°C. for 15 mins., homogenising under pressure of 40 kg./cm.^{2} and cooling to $<$10°C. 31.8.77 as 104407 (8pp22)

SUMO ★ D13 34104B/18 ★J5 4037-860

Preserving eggs during storage by application of a coating agent - consisting of gelatin or a mixt. of inorganic material e.g. calcium carbonate and gelatin or starch e.g. wheat starch and gelatin

SUMITOMO CHEMICAL KK 29.08.77-JA-103916

(20.03.79) A23b-05/06 A23l-03

Coating agent for egg storage, comprises gelatin, or a mixt. of gelatin and inorganic material or a mixt. of gelatin and starch. By coating the surface of the egg with the compsn. the freshness of the egg can be kept for a long period, without impairing taste or quality.

The gelatin may be any one, the inorganic material includes calcium carbonate, talc, diatomaceous earth, etc., which is pref. of particle size $\leq$10 μ. (pref. $\leq$1 μ). The starch includes wheat starch, potato starch, soluble starch, oxidised starch, etc. The amt. of starch used is 10 to 300

D 13: OTHER FOODSTUFFS -p. 8

organic material used is 1 to 100 wt. pts. relative to 100 wt. pts. of gelatin. The compsn. is made into a 1 to 20 wt.% aq. suspension, and coated on the surface of egg by spraying or immersion, followed by drying at 30 to 70°C. 29.8.77 as 103916 (3pp)

AOKI/ ★ D13 34116B/18 ★ J5 4037-896
Enhancing flavour of soybean paste - by adding Chlorella extract
AOKI S 29.08.77-JA-102631
(20.03.79) A23l-01/20

Process comprises adding >0.2% on the wt. of soybean paste of a soln. extracted from Chlorella in the presence of lactic acid bacteria or extraction soln. with hot salt water. Addn. is made during prepn. of raw material for s soybean paste, or to semi-finished soybean paste or finished soybean paste.

The lactic acid bacteria is e.g. lactobacillus Brugaricas and/or yugrti. The extn. soln. of Chlorella is produced e.g. by extracting in the presence of lactic acid or lactic acid bacteria, or by dissolving Chlorella powder in water and adding salt. Extn. soln. contains growth accelerating factors such as vitamins and aminoacids. 29.8.77 as 102631 (6pp43)

KASH- ★ D13 34177B/18 ★ J5 4038-282
Scorching inhibitor for cooking utensils - is prepd. by mixing edible oil, lecithin and water with a poly:ol, and adding to LPG as jetting agent
KASHIWA KAGAKU KOGY 01.09.77-JA-104213
G04 P28 (22.03.79) A47j-27 C09k-03/30 C10m-01/06

A scorching inhibitor is mfd. by making up a base prepn. comprising 100 pts. of the emulsion of 6-55% edible oil, 1-48% lecithin, and 40-94% water and 0.1-4 pts. of a polyhydric alcohol, and packing 9-7 pts. of the base prepn. and 1-3 pts. of LPG as a jetting agent into a pressure container with accessories, e.g., sprayer, etc. The edible oils used include sorbitan fatty acid esters, glycerol fatty acid esters, propyleneglycol fatty acid esters, etc.

The scorching inhibitor prevents the scorching of foods upon cooking without causing the deterioration of foods being cooked, and reduces the amt. of edible oil used. 1.9.77 as 104213 (4pp117)

NISS ★ D13 34504B/18 ★ J5 4039-693
Checking state of minor constituents in blended animal feed - by mixing copper chlorophyllin sodium with other minor constituent and spectrophotometric or visual determn.
NISSHIN FLOUR MILL KK 05.09.77-JA-106453
C03 J04 R16 (27.03.79) A23k-01 G01n-09

Method comprises mixing copper chlorophyllin sodium with other minor constituents, blending the mixture as minor consistuent into blended food, and checking the blended state of minor constituents by detecting the copper chlorophyllin blended.

The blended state of minor constituents in blended animal feed can be rapidly and surely checked by simple and safe process.

Specifically the amt. of Cu chlorophyllin sodium added is $\geqslant$0.005-0.03% or more based on total amount of blended animal feed. Copper chlorophyllin sodium colours very sensitively and can be determined precisely by spectrophotometer (at 630 nm. and 405 nm.) or be detected visibly by eyes. Minor constituents to be checked are vitamins, antibiotics, etc. 5.9.77 as 106453 (5pp50)

TONO/ ★ D13 34537B/18 ★ J5 4040-176
Granular feedstuff prepn. - by granulating mixt. of fish meal, seaweed powder, humus and dry powder of gramineous plant
TONO-OKA K 02.09.77-JA-104755
C03 (28.03.79) A23k-01/20

Prepn. of granular feed-stuff comprises mixing fish meal, marine weed powder and humus soil with dry powder of gramineous plant such as grass, and then pressure-formulating the mixt. as granules.

The feed-stuff gives resistance against disease and a high unit of nutrition, to domestic animals such as cows, pigs, and hens, and increases the birth ratio, further promotes the growth. Since it contains humus soil, it keeps the acidic property. It can be easily digested. Since it is compressed and dried, it has a small volume, and therefore, it can be easily stored and transported. Since i contains humus soil, there does not occur the generation of fungi or putrefication. 2.9.77 as 104755 (3pp108)

ORIY ★ D13 34538B/18 ★ J5 4040-197
Feedstuff for plankton - obtd. by dispersing fat and oil in water as fine particles
ORIENTAL YEAST KK 06.09.77-JA-106353
C03 P14 (28.03.79) A01k-61 A23k-01/18

Feed-stuff for plankton, is obtd. by dispersing fat-and-oil in water as particles of size 1-20 µ. In the cultivation of plankton which takes as food baker's yeast, the feed-stuff in an amt. of 0.003-0.012% (calculated as the weight of fat-and-oil) is added to the culture liquid.

The fat-and-oil is taken by plankton and is accumulated in the body. The obtd. plankton is used as feed-stuff for c tivated fish.

As fat-and oil there is pref. used one which is liquid at 20-30°C. The used amount of fat-and-oil is 0.003-0.01 % of the culture liquid of plankton. 6.9.77 as 106353 (4pp108)

Cream cheese mfr. - using pre-cheese mixt. of milk, cream and added whey protein subjected to ultrafiltration
DORR OLIVER INC 17.10.77-US-842654
(19.04.79) A23c-19/12

In a process for the prodn. of cream cheese, at least part of the milk and cream raw materials are subjected to ultra-filtration to form a pre-cheese mixt. Extra whey protein is then added and the mixt. is coagulated and stabilised to form the cheese.

The process allows the prodn. of cream cheese having the required content of butter fat and other components using less costly raw materials than prior art processes. 9.10.78 as 010138 (11pp513)

Automatic control system for fat standardisation in flowing milk - has fat content sensor located before mixer for mixing full and skimmed milk, to ensure stable fat content
GERAIMOVICH O A 24.05.76-SU-365020
P13 R26 (23.05.78) A01j-11 G05b-13

Automatic control system is used in fat standardisation in flowing milk. It uses two flow pipelines for full and skimmed milk, each with flow transducers and regulating valves, and a common control unit.

In order to ensure stable fat content in the standardised milk, the control system is provided additionally with fat content transducer which is placed before the mixer.

The programmer forms a proportional signal which controls the ratio of skimmed and full milk by varying the amplification coefft. of the valves control mechanisms. Geraimovich, O. A. Bul. 23/25.6.78. 24.5.76. as 365020 (2pp847)

Substitute of plain milk for calves and piglets - contg. dried skimmed milk, whey, protein hydrolysate, fat, sugar, vitamin(s), emulsifier, furfurol, calcium hydrogen phosphate and blood
LIVESTOCK RES INST (MEAT=) 11.02.76-SU-324862
C03 (23.05.78) A23c-11

The plain milk substitute for calves and piglets feeding lysate, an animal fat, sugar, vitamins and an emulsifier is improved by addition of furfurol, $CaHPO_4$ and blood components.

The taste and aroma of the product and its nutritive value are improved. The product is cheaper than the natural plain milk; the latter can be excluded from the calf diet from the 11th day of its life.

The compsn. contains (in wt. %) dried skimmed milk 40-70, dried whey 1.0-5.0, blood components 5.0-15.0, protein hydrolysate 1.0-4.0, animal fat 17.0-30.0, sugar 1.0-5.0, vitamins 1.5-3.5, emulsifier 2.6-5.6, furfurol 0.003-0.006, $CaHPO_4$ 0.5-0.7.

Laurel leaf tablets prodn. - using comminuted leaves mixed with common salt, drying and stamping into tablet form

MOSC FOOD IND TECHN 25.10.76-SU-415472
(16.06.78) A23l-01/22

Laurel leaf tablets are produced by first comminuting the leaves and then mixing with common salt of 55-60% moisture content. Then the mixture is dried, stamped into tablets and subjected to final thermal processing. The stirring process takes 15-18 mins. at 20-25°C, but the drying processes is carried out at 65-70°C for 45-50 mins.

Proposed production method allows the volume (mass) of laurel leaves used to be reduced by more than 40 times (compared with earlier methods), to completely eliminate manual labour during metering and packing of materials, to considerably reduce costs or transportation and to update the presentation of the marketed product.

J01 Q39 (17.04.79) B01d B67c

Separator has an outlet pipe for purified water leading to an over flow chamber outside the separator. The outlet pipe is of processively increasing dia. from separator to the outlet pipe leads into the lower end of a conical funnel which enlarges progressively in cross-section to an overflow edge at the top of the funnel.

The outlet pipe is pref. formed with bends as gentle as possible and certainly without sharp channels of direction. The interior of the funnel pref. presents $\geqslant 1$ coaxial, annular gutter with outlet channels radiating outwards to carry uprising liq. to the rising wall of the overflow funnel. A flexible, leak proof, extensible coupling is pref. fitted between the outlet pipe and the funnel. This permits a pref. facility to adjust the overflow funnel w.r.t. the chamber.

Divergent and practically unrestrictef low ensures that the overflow is capable of rapidly discharging spasmodic peak loads with virtually no change in the liq. surface level within the separator. 29.12.78 as 873186 (10pp448)

Removal of complexed transition metals from effluents - by cementation with aluminium or magnesium

FREIE & HANSESTADT 27.09.74-DT-446117
*J01 M11 (26.04.79) *DT2446-117 C02c-05/02*

A plant for the separation of transition metals in complex compounds such as tartrates, from industrial effluents, by means of metals higher in the electropositive scale than the transistion metals, obtains the recovered heavy metals in a form which can be processed further directly.

The vessel for the effluent has an agitator, and the exchange metal has the form of a number of plates of aluminium or magnesium, immersed in the effluent. 27.9.74 as 446117 (5pp1045)

NORM- D15 19990Y/12 =DS 2559-324

Composted humus continuously produced from wet biological sludge - by aeration followed by hot drying to accelerate moisture extraction

NORM AMC AG (KAEL/) 03.12.75-CH-015749 (12.11.75-CH-014705)
*C04 (26.04.79) *BE-848-158 C05f-07*

Continuous processing of wet mud with 80-95% water content, obtd. from water purification plant, comprises treat

some water to leave a water content 55-80%; and composting at 65-85°C to produce a humus with 45-70% water, useful as fertiliser. 31.12.75 as 559324 (9pp047)

KEIL/ ★ D15 33443B/18 ★DS 2752-581

Water softening appliance - with plastics throwaway cartridge for ion exchanger resin sealed in sheet metal tank

KEIL W 25.11.77-DT-752581
A91 J01 (26.04.79) C02b-01/40

Small-scale water softening without a bypass is effected in a stainless steel sheet tank with an exchangable plastics cartridge. The cartridge can be made of polyethylene, and has a perforated bottom and a neck with a male thread at the other end with a perforated cover. Seal rings between a chamfer on the neck and the cover, and on a groove near the bottom seal the cartridge against the tank walls. A conductivity meter is mounted on the tank cowl.

This replaces the complications of any regeneration of the ion exchanger resins by a throwaway cartridge. The spent resins can be used as fertilizer and the cartridge is easy to produce by blow moulding. 25.11.77 as 752.581 (4pp39)

BECK/ ★ D15 33446B/18 ★DS 2808-703

Treatment of effluent waters contg. fats and proteins - by flocculation with anionic starch and flotation to give a protein slurry suitable e.g. as animal feed

BECKER D J 01.03.78-DT-808703
C03 (D13) (26.04.79) A23k-01 C02c-05

In the purificn. of waste waters contg. fats and protein components, the water is opt. mechanically cleaned and the pH is then adjusted to around the average isoelectric point of the main protein components present. The water is then mixed with an aq. soln. of a substd. anionic starch with constant stirring.

After standing for a short time the mixt. is subjected to release flotation under a dispersion pressure of 4.5-6 bar and the flotation slurry is sepd. from the clarified waste water. The slurry is removed and sterilised by passage, at least once, through a UV disinfection unit. The clarified water, opt. after a subsequent biological clarification stage, is passed into the drains.

Process allows treatment of effluent waters e.g. from dairy produce plants, meat- and poultry processing plants, etc., to give recovery of the fat and protein components in a form suitable for re-use. 1.3.78 as 808703 (5pp513)

Liq. purificn. in contact beds - with direct introduction of oxygen for microorganism growth

ALBERSMEYER W 17.10.77-DT-746648
(26.04.79) C02c-01/02

Liquids are purified in a contact bed with a filling, pref. of plastics, which is sealed at the bottom by a barrier layer of purified liq. maintained at a constant height by syphon or by pressure controlled valves. O_2 is introduced at various levels for the microorganisms. The O_2 flow rate, temp. moisture and pressure are controlled for optimum growth conditions.

The direct application of O_2 to the microorganisms improves their physiological performance and raises the efficiency considerably, even when used for sewage which is otherwise difficult to clean. 17.10.77 as 746648 (12pp39)

LICN ★ D15 33503B/18 ★DT 2746-917

Liquid irradiation device - with adjustable inclined treatment plate fed by diffusors and rising vessel

LICENTIA PATENT GMBH 19.10.77-DT-746917
J04 K08 (26.04.79) B01j-01/10 C02c-01

Liquids and pastes, esp. sewage sludge, is radiated by an electron beam over an inclined irradiation plate. The material to be irradiated is supplied at an adjustable rate through one or several diffusors to the bottom of a rising vessel. The latter has an overflow edge which discharges the liquid over the irradiation plate.

This arrangement ensures a constant and uniform layer thickness in the irradiation zone. The layer thickness can be easily matched to the electron energy available by altering the angle of inclination of irradiation plate.

MOTA ★ D15 33540B/18 ★DT 2747-424
Refuse fired gas generator - with cooling water recycled through pressurised heat exchanger (DK 2.4.79)
MOTALA VERKSTAD AB 08.09.77-DK-004004 (21.10.77-DT-747424)
H09 (26.04.79) C10j-01

In a gas generator plant for the gasification of refuse or digested sewage sludge the water-soluble organic compounds together with the condensate are recycled to the gas generator. This fluid circuit which includes a heat exchanger has upstream and/or downstream pressure control devices for the water.

Arrangement prevents the deposition of dissolved particles which cause clogging and loss of efficiency in heat transfer. 21. 10. 77 as 747424 (12pp39)

DAIDO TOKUSHOKO KK 29.08.77-JA-104105

A91 E36 (19.03.79) C02c-05/02

In removal of P components from a waste water by adding alum to convert the P-components into Al phosphate which is then coprecipitated with flocs of Al hydroxide formed simultaneously, the improvement comprises adding to the system bicarbonate ion to stabilise and to grow-up the flocs of Al hydroxide so that the P removability is improved.

In an example, 74 ppm. of alum is added to a treated waste water (subjected to the activated sludge aeration treatment) if necessary together with a polymer coagulant, e.g. polyacrylamide, etc. under agitation while blowing in a CO_2-contg. gas and maintaining the Ph at 5-7 to form Al phosphate which is adsorbed on flocs of $Al(OH)_3$. The $Al(OH)_3$ flocs are effectively stabilised in the presence of > 3 ppm. of HCO_3^-. The P removability was 87%. 29.8.77 as 104105 (2pp34)

TOAD- ★ D15 34119B/18 ★J5 4038-187

Removing sulphur ions from liq. sample e.g. river water - before determn. of cyanide concn., by fixing cyanide as ferrocyanide and acidifying to evaporate hydrogen sulphide gas

TOA DENPA KOGYO KK 31.08.77-JA-104641

E36 J04 R16 (22.03.79) G01n-01 G01n-31

Method comprises adding ferrous sulphate ($Fe(SO_4)$) and/or ferrous ammonium sulphate ($Fe(NH_4)_2(SO_4)_2 . 6H_2O$) to the sample liq. to fix cyanide (CN) contained in the sample liq. as ferrocyanide complex, reducing the pH value of the sample liq. to <2.0 with the addn. of H_2SO_4 etc., and thus sepg. and removing sulphur ion contained in the liq. as H_2S gas. Pref. $KMnO_4$ soln. is added to the sample liq. to oxidise and remove remaining sulphur ion.

Sulphur ions interfering with the determn. of total cyanide concn. by ion-selective electrode method can be satisfactorily removed with high removing rate by simple operation. The method is useful for the determination of total cyanide concn. in river water, industrial exhaust wa er, etc. 31.8.77 as 104641 (3pp50)

TOKE ★ D15 34162B/18 ★J5 4038-26

Ozone-oxidn. deodorising appts. - in which gas to be treated is firs admixed with air of specified relative humidity

TOKYO SHIBAURA ELEC LTD 01.09.77-JA-104185

J01 P34 (22.03.79) A61l-09 B01d-53/03

In the deodorising of malodorous gas, e.g. H_2S, the gas is reacted with O_3 generated from an ozoniser in an activated carbon-packed reactor, gas to be treated is mixed prior to deodorising treatment, with the air of relative humidity 30-60% or 0.5-2 x smaller than the relative humidity of the gas to be treated, controlled by means of a drier, refrigeration, or dehumidifier.

Process gives prolonged efficient deodorisation since lowering of catalytic activity of activated carbon due to the deposition of moisture on its surface is prevented. A pollution is reduced. Process is partic. suitable for trea ing gases from sewage treatment. 1.9.77 as 104185 (3pp117)

MICH- ★ D15 34167B/18 ★J5 4038-2

Treating waste solids and sewage sludge - by maintaining elevated temp. and pressure in reactor contg. aq. mediu introducing gas contg. oxygen, etc.

MICHIGAN TECK FUND 31.08.77-JA-104689

P41 (22.03.79) B01j-01 B03b-07

Waste solids and sewage sludge are introduced into a ti ly sealed space reactor kept at a temp. of 150-450°C. a a pressure of 21.1-211 kg./cm.^{2} contg. an aq. medium and a gas contg. O_2 is introduced into the aq. medium. T waste solids and sewage sludge are thus thermally oxidi until the COD is lowered below a rate of 10-95%.

The oxidised material is then divided into a liq. phas and a solid phase. The solid phase is introduced in a th mally decomposing chamber contg. a flow of molten lead whereby a gas component contg. methanol, ethanol, benzene, xylene and toluene is sepd. from a solid component contg. carbon, metals and other inorganic material.

Process is used to treat solid waste material and sewage sludge produced in a city zone. 31.8.77 as 104689 (9pp15)

Bromide ion recovery from soln. contg. organic acid or salt - by electrodialysis in bath contg. cation and anion exchange membranes opt. with addn. of organic base

SUMITOMO CHEMICAL KK 01.09.77-JA-105468

A97 E37 J03 (22.03.79) B01d-15/04 B01j-01/08 C01b-07/10

Bromide ion is recovered from a soln. also contg. organic acid or salt of mol. wt. <500 and carboxylic and/or phenolic hydroxide, by electrodialysis at $pH < 5$, opt. with the addition of organic base. The electrodialysis bath is equipped with cation exchange membranes and anion exchange membrane alternately.

The method is used to recover bromide ion from industrial waste water.

The pH is controlled by the addn. of mineral acid and/or organic high molecular acid, such as polystyrene sulphonic acid, etc. 1.9.77 as 105468 (5pp42)

MITO ★ D15 34278B/18 ★J5 4038-657

Biological degradation of waste polyurethane foam - together with e.g. sewage sludge, in fermentation tank in presence of air

MITSUBISHI HEAVY IND KK 31.08.77-JA-103658

A35 (A25 D16) (23.03.79) C02c-01/02

Waste polyurethane foam (polyurethane sponge) is completely decomposed by biological degradation without any generation of harmful gas by supplying pieces (10-30 mm.) of the waste polyurethane foam and a sludge, e.g. sewage sludge and sewage digested sludge etc. to a mixer wherein they are thoroughly mixed together; transferring the mixture to a fermentation tank in which perishable org. matters contained in the sludge are almost completely decomposed during residence time under aerophilic state (by admitting a pref. amt. of air from an air inlet at 60-70°C. discharging the fermentation-completed mixt. to the outside; and subsequently separating the mixt. into a by-product compost obtd. from the perishable org. matters and the polyurethane foams pieces which are considerably decreased in amt. by the biological degradation.

The polyurethane foam pieces thus sepd. are recycled to the mixer to subject them to further fermentation degradation treatment. 31.8.77 as 103658 (3pp34)

SUGI/ ★ D15 34279B/18 ★J5 4038-658

Waste water treatment to lower BOD and COD - by adding polymerisation initiator under agitation and irradiation eg with mercury lamp

SUGIURA K 31.08.77-JA-103698

(23.03.79) C02c-05/02

Waste water having very high COD and BOD content which is difficult to decompose biologically by conventional treatment is treated by adding a polymerisation initiator, e.g. $K_2S_2O_8$, under agitation and irradiation of electromagnetic wave of wavelength 1, 000-4, 000 Å e.g. with low pressure Hg lamp to react the COD and BOD components to form a water-insoluble sludge.

Oxidn. agent e.g. Cl_2, NaClO, H_2O_2, $KMnO_4$ etc. may be added. As polymerisation initiator assistant may be use used a reducing agent, e.g. $Na_2S_2O_3$, Na_2SO_3, $NaOHSO_3$, $FeSO_4$, $FeCl_2$, $FeCl_3$, H_3BO_3, ZnO, TiO_2, Na_2HPO_4 etc. 31.8.77 as 103698 (5pp34)

KAGO- ★ D15 34280B/18 ★J5 4038-659

Treatment of pectin contg. effluent from orange processing - involves preheating to enhance separability of pectin-contg. solids and facilitate active sludge treatment

KAGOME KK 01.09.77-JA-104218

(23.03.79) C02c-05/02

In pre-treating a pectin-contg. effluent resulting from orange processing with $Ca(OH)_2$ so as to carry-out coagulation sepn., improvement comprises heating the effluent at >50°C., so that the removability of the pectin and floated matters is increased in a large extent, thus facilitating subsequent activated sludge treatment.

In an example, an effluent from orange peeling, having the COD value of 2, 093 ppm., total pectin content of 1, 960 ppm., and the floated matters content of 916 ppm. is heated at 50°C., after which 0.2% of $Ca(OH)_2$ is added under agitation for 3 mins. followed by allowing to stand for 10 mins. to give a supernatant liquor having the COD value of 1, 761 ppm., the total pectin content of 45 ppm. and the floated matters content of 110 ppm. 1.9.77 as 104218 (2pp34)

HITA ★ D15 34281B/18 ★J5 4038-660

Ammoniacal nitrogen removal from waste water - by adding a zeolite and then an organic coagulant to coagulate and ppte. the zeolite

HITACHI KK 02.09.77-JA-104880

(23.03.79) C02c-05/02

In removing by adsorption NH_4-N from a NH_4-N-contg. waste water with zeolite, the improvement comprises contacting the waste water with zeolite having the granular size of <200 mesh to remove by adsorption NH_4-N, and subsequently adding an organic coagulant to coagulate and ppte. the zeolite, so that the NH_4-N adsorbability (against the zeolite) is accelerated.

The NH_4-N adsorbing coagulated zeolite is easily regenerated in its adsorbability by treating it with alkali(ne earth) metal ion, e.g. Na^+ etc. under elevated temp., and the NH_4-N adsorbability is hardly lowered even carrying-out repeatedly the heat regeneration.

The NH_4-N adsorbing rate of the zeolite is very rapid when the granular size of the zeolite is <200 mesh, but the zeolite is very difficult to be settled under that granular size. The organic coagulant is added to accelerate the settling of the zeolite. 2.9.77 as 104880 (5pp34)

Conversion of waste sludge from filtration plant to landfill material - by treatment with aluminium sulphate and macromolecular flocculant, centrifuging, and drying solid

OSHIO SANGYO KK 02.09.77-JA-104974

A81 J04 (26.03.79) B01j-01 C02c-03

The method comprises adding aluminium sulphate to the waste sludge to settle it; thereafter adding a macromolecule type aggregating agent to the resulting settled substance to obtain a mixt. thereof; centrifugally sepg. the mixt. to obtain a solid substance and a liq.; and heating the solid substance to solidify it. The aggregate agent is sodium polyacrylate, polyethylene imine, polyacrylamide, polyoxyethylene, or a maleic copolymer.

Typically, a waste sludge is mixed with an aggregating agent, the mixt. was introduced into a centrifugal separator to produce a liq. and solid; and the solid is heated in a drying furnace at 200-500°C. to obtain a dried cake. 2.9.77 as 104974 (3pp51)

HITG ★ D15 34412B/18 ★J5 4039-373

Dehydration and calcination of waste sludge - with addn. of coal powder, macromolecular flocculant and lime

BABCOCK-HITACHI KK 02.09.77-JA-105004

A81 J04 (26.03.79) B01j-01 C02c-03

Method comprises mixing a waste sludge with powdery coal, a macromolecular type aggregating agent, and lime, and calcining the mixt. to prevent generation of SOx, NOx, and hexavalent chromium.

The method comprises adding 20-40 wt. pts. of powdery coal of 170 mesh and 0.2-1.5 wt. pts. of a macromolecule type cationic aggregating agent to the waste sludge, thereby removing foul fumes from the waste sludge; simultaneously dehydrating the waste sludge to obtain cake; adding lime or limestone to the cake at 1-10 of a molecular rate to obtain a mixt. thereof; and calcining the mixt. in a fluidised bed type calcining furnace. 2.9.77 as 105004 (7pp51)

NIDE ★ D15 34418B/18 ★J5 4039-383

Appts. for continuous treatment, e.g. oxidn. or redn., of liq. - comprises partitioned container with open cylinder in each compartment for treating gas introduction

NIPPON ELECTRIC KK 02.09.77-JA-106099

J04 (26.03.79) B01j-10 C02c-05/02

Appts. comprises a container having a liq. inlet port at one end and a liq. outlet port at the other end; a number of sets of partition walls dividing the chamber into a number of compartments, each set including a first wall extending from the bottom of the container and terminating at a spaced distance from the top wall of the container, and a second wall extending from the top wall of the container and terminating at a spaced distance from the bottom wall of the container; an open-ended cylinder disposed within each compartment; and a gas injection tube opening into each cylinder.

As the liquid continuously passes through the successive compartments, it is repeatedly contacted with the gas injected into the cylinders. 2.9.77 as 106099 (4pp47)

OHTA/ ★ D15 34420B/18 ★ J5 4039-386
Membrane sepn. appts. for treating waste liq. - includes perforated stainless steel tubes, fibrous mat, perforated polypropylene film and reinforcing discs
OHTA J 03.09.77-JA-105993
A88 J01 (26.03.79) B01d-13

Appts. for filtering waste liquid by the use of an osmotic membrane comprises a tube including an inner perforated tube surmounting the inner tube and formed from a thin-walled stainless steel sheet. The perforations of the outer tube are smaller in dia. than those of the inner tube. A fibrous mat is applied to the surface of the outer tube, and a perforated polypropylene film covers the fibrous tube layer. A number of axially spaced reinforcing discs are inserted into the inner tube.

The tube assembly is placed within a sealed casing to which a waste liquid is introduced under pressure so that pure water passes through the fibrous tube layer into the tube and is then recovered through one end of the tube. 3.9.77 as 105993 (3pp47)

KAME- ★ D15 34518B/18 ★ J5 4039-951
Water treatment with magnetic particles e.g. of ferrite - to reduce contamination by nutrients e.g. phosphate
KAMEI DIECAST KOGYO 04.09.77-JA-106139
(28.03.79) C02b-01/14 C02c-05/02

Contamination of natural water, e.g. fresh water in lake and swamp etc. sea water and industrial or domestic waste water etc. by nutrients enrichment, e.g. with PO_4^{3-} or NH_4-N or with a wide variety of bacteria, further with the generation of plankton etc., is effectively prevented by spraying permanent magent grains, e.g. of ferrite etc., on the water so that it stays at the bottom as long as possible.

Typically, when a sewage-treated water having COD value of 20 ppm., BOD value of 14, total oxygen content of 29 ppm., 30 ppm. of suspended solids, 10.9 ppm. of NH_4-N and 4.53 ppm. of PO_4^{3-} is passed through a filtration appts. packed with granular ferrite to give a treated water having COD value of 8 ppm., BOD value of 10 ppm., total oxygen content of 9 ppm., suspended solids content of 3 ppm., NH_4-N of 10.7 ppm. and PO_4^{3-} content of 0.54. It was proved that PO_4^{3-} is effectively removed by the action of ferrite. 4.9.77 as 106139 (4pp34)

KURS ★ D15 34519B/18 ★ J5 4039-952
Water purification - by passing through porous membrane of hollow fibres consisting of PVA-contg. polymer
KURARAY KK 05.09.77-JA-107120
A88 J01 (A14) (28.03.79) B01d-13 C02b-01/82

Method comprises passing water through a porous membrane made of hollow fibres having holes of dia. 0.005 to 1.0 μ, composed of a PVA-bearing polymer having a polymerisation degree of 500 to 3,500 and a saponification degree of 85 to 100 mol.%, to remove very fine granules and microorganisms.

The membrane has excellent resistance to acid, alkali, and heat, so washing and thermal sterilisation of the membrane can be carried out under severe conditions, and regeneration of the membrane is carried out easily.

The membrane is made e.g. by adding 100 pts. wt. of polyethyleneglycol to 100 pts. wt., preparing an aq. soln. having a PVA concn. of about 15%, introducing the aq. soln. into a coagulation bath ($NaOH/Na_2SO_4$=70/240 g./l.) through a ring-shaped nozzle to give hollow fibres which are then immersed in a treating bath at 70°C. for 5 hrs. so as to be crosslinked, followed by treating with hot water (93°C.) for 3 hrs. and water-washing and drying. 5.9.77 as 107120 (4pp34)

Water spray device for contact oxidation of waste water - has adjustable cylinders fixed spray plate above the filler
KUBOTA KK 09.02.76-JA-014645
*(09.04.79) *J52096-977 B01j-10 C02c-05/04 +B01d-03/26*

Device is described for spraying water over a filler charged in a contact oxidising device treating contaminated water. The device has adjustable cylinders fixed to a spray plate. The filler is charged in an oxidising cell and a raw water fed into the cell, while oxygen is fed into the cell to contact the water with an active treating layer coated over the surface of the filler, to oxidise the water.

The spray plate is disposed in an upper section of the cell and above the filler. Spray holes are bored through the plate to spray the water over the filler through the cylinders. A distributing channel structure is disposed over the plate to distribute the water fed onto the plate over the holes. 9.2.76 as 014645 B01j-10/00; F02c-5/04; B01d-3/26 (9.2.76) KUBOTA KK (5pp26) (J52096977)

Appts. for treating waste water - by electrolytic action usin particulate aluminium anode and particulate iron cathode

BOULIGNY R H INC 14.11.77-US-851110 (31.05.77-US-801653)

J03 (17.04.79) C02b-01/82 C02c-05/12

Waste water is treated electrolytically in an appts. whic includes a treating chamber operating as an electrolytic cell. The anode in the cell is particulate aluminium whi the cathode is particulate iron and is disposed close to th aluminium. Water containing dissolved solids is used a the electrolyte.

In operation the aluminium and iron dissolve and floc produced in the treating chamber. The floc-laden water may be transferred to a holding chamber where it is mi with the waste water. The floc absorbs the impurities from the waste water.

The method is used for treating waste water having a high concentration of petroleum waste products, e, g. waste obtained from a machinery cleaning operation whe the effluent includes acids, alkalis, oil and grease, sol ents and heavy metals. The method minimises slime ac umulation on the electrodes. 14. 11. 77 as 851110 (10pp

In vitro culture of hepatitis A virus - useful for the prepn. of speci antigens, immuno-serums and vaccines

INST VIROLOGIE TOUR 29.07.77-FR-023372

B04 (30.03.79) A61k-39/12 C12k-07

Complete hepatitis A virus is extracted from the stools, blood or its derivs. are taken from subjects (man or ani mals) suffering from hepatitis A, or from the liver, bil or any organ or fluid from an animal infected experimen ally by centrifuging, adsorption, chromatography or ult centrifuging. The virus may then be conc. to the min. necessary for replication on diploid cultures.

Replication is then effected by a series of passages on cell material of the virus, in the course of which the apparent speed of development of the virus accelerates, resulting in a large quantity, which is industrially exploitable, of hepatitis A virus, consisting of a mixt. of complete viral particles and empty capsides of genetic material.

The complete viral particles are capable of producing a rapid and useful amt. of viral material on diploid cells. Process is used to produce specific reactive antigens, immunoserums and vaccines against hepatitis A. 29.7.77 as 023372 (8pp520).

CUVE- ★ D16 33792B/18 ★FR 2398-677

Stainless steel vat for storage of wine - has internal coating of phenolic or epoxy resin

CUVES ET REVETEMENT 28.07.77-FR-023856

A82 Q32 Q34 (A21 A92) (30.03.79) B65d-25/14 B65d-87/24

Internal surface of a stainless steel vat for the storage of wine is first sanded, and then isolated from the liq. by means of a coating of (a) phenol-formaldehyde resin, pref. applied in four or five oven polymerised layers, or (b) an epoxy resin, without thixotropic agent, which can be applied by projection in monolayer. The stainless steel used is partic. austenitic or ferritic stainless steel.

The coating prevents corrosion of the electrochemical type occurring at the internal stainless steel surface, and lessens the deposit of tartar contained in the wine onto the internal surface. 28.7.77 as 023856 (4pp1319).

POMP- ★ D16 33793B/18 ★FR 2398-679

Elevating band conveyor for winemaking grapes etc. - has lower end band tensioning assembly of sanitary construction

POMPES MACH HYDRA 26.07.77-FR-023839

Q35 (30.03.79) B65g-19/08 B65g-23/44 C12g-01

A band conveyor for elevating bulk material, partic. wet material possibly contg. pockets of liq. has a drive pulley at the upper end, and a band is fitted with transverse pusher slats or flaps.

At the lower end of the conveyor, the idler pulley has its shaft bearings mounted on a support which is slidable longitudinally in a guide channel. Sliding adjustment of the support regulated band tension. Between the bearings, the support is cut back in a radius coaxial with the pulley shaft so that the circumferential edges of the band slats ride in sealed contact on the radius. The guide channel has base and sidewalls and the support slides in leakproof contact with the channel surfaces.

Used for elevating wet material, partic. grapes for winemaking. Band tensioning is adjusted at the idle end pulley which provides for better band tracking and cleaner discharge than drive end adjustment. These advantages are combined with a hygienic design of tensioning unit which is easy to clean. 26.7.77 as 023839 (10pp448).

Cholesterol oxidase prodn. in surfactant-contg. medium - causing enzyme to be produced outside the cell

EASTMAN KODAK CO 07.11.75-US-629955

*A97 B04 R16 (02.05.79) *BE-848-070 +C07g-07/02*

Cholesterol oxidase (I) is produced by growing a suitable microorganism in a medium contg. $\geqslant 0.5$ g/l of a nonionic surfactant, the presence of the surfactant ensuring that extracellular (I) is formed, and the surfactant and any of its decomposition products being non-toxic to the microorganism in the quantity used.

Pref. the surfactant comprises a hydrophilic moiety which is a polyoxyethylene or polyglycidol moiety and a lipophilic moiety contg. $\geqslant$ 9C. Pref. the microorganism is Nocardia cholesterolicum species NRRL 5767 or 5768, and the medium contains (i) an inducer of (I) e.g. cholesterol, and/or (ii) yeast extract.

The need for complicated and costly cell harvesting techniques used in the prior art is eliminated. 8.11.76 as 046408 (14pp990)

WAKP ★ D16 34071B/18 ★J5 4037-798

determn.. of substrate quantity or enzyme activity - in enzyme reaction where hydrogen carrier e.g. NADH acts as coenzyme, by colorimetry using meldola blue

WAKO PURE CHEM IND KK 31.08.77-JA-104396

B04 J04 R16 (20.03.79) G01n-31/14 G01n-33/16

In the determn. of substrate quantity or enzyme activity in an enzyme reaction process a hydrogen carrier (e.g., NADH etc.), participates as the coenzyme. Change in the quantity of the reduced-type hydrogen carrier, which has correlation with the substrate quantity of the enzyme activity, is colorimetrically determined using Meldola Blue as the colouration reagent.

The method is used for diagnostic analysis such as determination of GOT (glutamic acid oxaloacetic acid transaminase) in blood serum, etc. Improved reproducibility is obtd. 31.8.77 as 104396 (7pp173)

CHOK/ ★ D16 34105B/18 ★J5 4037-876

Cultivating microorganism of species Saccharomyces cerevisiae - which is alcohol resistant and used in brewing, using enzyme for dissolving yeast cell body

CHOKAN K 27.08.77-JA-102194

(20.03.79) C12c-11/04 C12k-01/04

Microorganism belonging to the species Saccharomyces cerevisiae, which is useful for brewing, is cultivated in a liquid medium, and in logarithmic growing stage of the microorganism. Enzyme for dissolving yeast cell body in 5 to 20 percent alcohol soln. is acted upon the microorganism, and then non-dissolved microorganism is collected and subjected to liquid cultivation, the series of steps being repeated. Microorganism mutant having high resistance against the above enzyme is sepd. and concentrated, and then from the thus obtd. concentrate is sepd. mutant which is resistant against alcohol such as 20% alcohol soln. contg. 1% of glucose.

When brewing is conducted with the use of this mutant, the mutant is not killed even after long periods of brewing and thus properties of the resultant alcohol are not damaged. 27.8.77 as 102194 (4pp22)

MITN ★ D16 34106B/18 ★J5 4037-879

Yeast cell body prepn. in high concn. - by continuously cultivating e.g. yeast of genus Pichia which can assimilate (m)ethanol, under aerobic conditions

MITSUBISHI GAS CHEM IND 01.09.77-JA-105276

(20.03.79) C12c-11/08

Yeast which can assimilate methanol or ethanol is cultivated continuously in a culture medium contg. methanol or ethanol as the main carbon source at high cell body concn., whereby cell body of yeast is obtd. Sepn. of the resultant is easily conducted, and culture broth of high cell body concn. can be obtd., and thus dried cell body can be easily obtd. by direct drying of the culture broth by e.g. spray-drying.

The yeast which can assimilate methanol includes microorganism belonging to the genus Hansenula, Pichia, Torulopsis, etc. and that which can assimilate ethanol includes Saccharomyces, Hansenula, Pichia, Torulopsis, Candida, etc. Typical examples of the microorganisms are Pichia aganobii (FERM 2430) and Torulopsis methanoescule (FERM 2461). The cultivation is conducted under aerobic condition at the cell body concentration of 50 to 150 g./1. 1.9.77 as 105276 (9pp22)

KANE ★ D16 34107B/18 ★J5 4037-882

Stabilising activity of urokinase - by adding cpd. with di:sulphide and/or mercapto gps.

KANEBO KK 29.08.77-JA-104013

B04 (20.03.79) C07g-07/02

Activity of urokinase is stabilised by adding to a substance (I) contg. urokinase a cpd. (II) contg. disulphide and/or mercapto gps. (I) are e.g. those of specific activity >30,000 IU/g. as soln. or powder, e.g. crude urokinase soln. or powdery human urine. (II) is e.g. peptide or aminoacid such as L-cystine or cysteine, or coenzyme A, which is added as 1×10^2-5×10^5 mole/mole protein.

The process stabilises the activity of high specific activity urokinase of >30,000 IU/mg. for a prolonged period, preventing loss of activity during dialysis or concn. with membranes or hollow fibres based on cellulose, nylon etc. Used in the purificn. steps such as dilution, freezing or freeze-drying. 29.8.77 as 104013 (5pp43)

KYOW ★ D16 34108B/18 ★J5 4037-884
Choline dehydrogenase enzyme prepn. - by culturing a strain of Pseudomonas, Bacillus, Arthrobacter etc. in a medium contg. choline
KYOWA FERMENTATION KK 30.08.77-JA-103244
(20.03.79) C07g-07/02

Prodn. of choline dehydrogenase comprises culturing in a medium contg. choline a strain belonging to Pseudomonas (except for pseudomonas aeruginosa) Agrobacterium, Arthrobacter, Bacillus, Brevibacterium, Euribinia, Mycobacterium, Paracolobactorum, Salmonella, Zarcina, Aspergillus or Mucor, and collecting choline dehydrogenase from the cultured product.

Culture is effected in a medium composed of glucose, sucrose, etc., alcohols ammonia or other N sources and peptone and other natural nutrients, added with choline chloride, at 20-40°C. for 1-4 days. Collection is effected by conventional purificn. procedures. 30.8.77 as 103244 (6pp43)

KYOW ★ D16 34109B/18 ★J5 4037-885
Cholesterol oxidase purificn. - by contacting soln. contg. cholesterol oxidase with adsorbent and eluting cholesterol oxidase from adsorbent
KYOWA FERMENTATION KK 01.09.77-JA-104221
(20.03.79) C07g-07/02

Purificn. of cholesterol oxidase comprises contacting a soln. contg. cholesterol oxidase with a water insol. adsorbent obtd. by binding a substance similar to a substrate for cholesterol oxidase with a support, to adsorb cholesterol oxidase, and eluting the cholesterol oxidase.

The support is e.g., polymeric polysaccharides having amino or porous glass contg. amino gps., which is bonded with substance similar to the substrate like cholic and deoxycholic acid. The soln. contg. choline oxidase is e.g. filtrate of the cultured prod. of choline oxidase producing bacteria, or is e.g. produced by eliminating solids from crushed ground prod. of bacteria bodies sepd. from culture soln. of choline oxidase producing bacteria. Adsorption is effected e.g. at pH 6-8, and <30°C. The adsorbed enzymes are eluted with mixt. of DMF, DMSO, or other hydrophilic solvents and water.

The process produces cholesterol oxidase without requiring pretreatments like pptn. with $(NH_4)_2SO_4$, etc. 1.9.77 as 104221 (5pp43)

AJIN ★ D16 34110B/18 ★J5 4037-886
L-threonine prodn. by fermentation - using Prebibacterium microorganisms which are resistant to p-chloro-meta-tri:chloro:methyl phenyl:alanine
AJINOMOTO KK 31.08.77-JA-104324
B05 E16 (20.03.79) C12d-13/06

Prodn. of L-threonine by fermentation comprises collecting L-threonine accumulated and produced by culturing in a culture medium a variant strain belonging to Brevibacterium which is resistant to p-chloro-metatrichloromethyl-phenylalanine and capable of producing L-threonine. Typically the process produces L-threonine by culturing, e.g. Brevibacterium lactofermentam at 27-37°C., and pH 5-9 in aerobic conditions.

In an example, Brevibacterium lactofermentam Aj 11186 is inoculated into a culture medium composed mainly of 10 g./l. glucose, 4.5 g./l. ammonium sulphate and other nutrients to give 1 litre of culture soln. Centrifugal sepn. and column purification with Amberlite IR-120, followed by elution with 3% ammoniacal water and concn. and crystallisation after decolouration yielded 5.4 g. (> 98%) pure L-threonine. 31.8.77 as 104324 (4pp43)

BANY ★ D16 34111B/18 ★J5 4037-887
7-2-Thienyl:acetamido cephalosporanic acid prodn. - by reacting 2-thienyl:acetic acid or its deriv. with 7-amino-cephalosporanic acid in presence of Arthrobacter enzyme
BANYU PHARM CO LTD 30.08.77-JA-103229
B02 C02 (20.03.79) C12d-09/20

7-(2-Thienylacetamido)cephalosporanic acid (I) is prepd. by reacting 2-thienylacetic acid or its reactive deriv. with 7-aminocephalosporanic acid (II) in the presence of a cultured prod. or treated culture broth of Arthrobacter enzyme, in an aq. medium.

Reactive deriv. of 2-thienylacetic
alkyl -2-thienylacetate (e.g. methyl ester, ethyl ester)
and 2-thienylacetamide. Enzymatic reaction is carried out
at 20-45 (28-35)°C. in pH 5.0-8.0 (6.8-7.5) for 1-5 hrs.
A concn. of (II) is 0.1-10 (2-5) mg./ml. 30.

(I) is obtd. by acylating enzymatically (II) with 2-thienyl
acetic acid or its reactive deriv. over a cultured prod. of
treated culture broth of Arthrobacter enzyme. 30.8.77 as
103229 (3pp104)

AJIN ★ D16 34112B/18 ★J5 4037-888
Pullulan prepn. by cultivating aureobasidium genus bacteria - using partly decomposed cellulose (cello oligosaccharide) as carbon source
AJINOMOTO KK 30.08.77-JA-103812
B04 (20.03.79) C12d-13/04 C12k-01

Pullulan (I) is prepd. by cultivating a pullulan producing bacterium of Aureobasidium genus with partially decomposed cellulose (cello-oligosaccharide) as carbon source.

Cello-oligosaccharide forms a cheap carbon source.
Pullulan producing bacterium includes e.g. Auerobasidium
pullulans AHU 9553, IFO 4464, IFO 6353, IFO 6401, IFO
6402 and the like. Particularly IFO 6464 and IFO 6402 are
pref. Partially decomposed cellulose includes a mixt. of
cello-oligosaccharide such as cellobiose, cellotriose,
cellotetraose, cellopentaose or cellohexaose. Culture is
carried out at 25-35°C. at pH 5-8.0 for 2-8 days. 30.8.7

Seasoning agent soln. prodn. - using protein solubilising enzy
and aminopeptidase and carboxy:peptidase in yeast to give
aminoacid(s) content
TANABE PHARMACEUTICAL KK (UEDA-) 26.08.77-JA-102894
(20.03.79) A23l-01/23 C12d-13/10

The process comprises mixing a hydrolysis soln. obtd
by hydrolysing protein raw material modified with an
zyme prepn. composed of protein solubilising enzyme,
with a treated bacterial body obtd. by immersing non
resistant yeast bacterial body and koji bacteria body,

conditioning the mixt. in the presence of salt, or mixing the hydrolysis soln.with the non-salt-resistant yeast bacteria and koji bacteria body, treating the mixt. in the presence of salt and conditioning it.

The protein solubilising enzymes are e.g. endo type protein decomposing enzymes e.g. produced from bacteria e.g. Bacillus amilolquefacence bar Neyagawa. The non-salt-resistant yeasts are e.g. yeasts for sake wine or yeasts for bread. The process, using strong protein solubilising enzymes and aminopeptidase and carboxypeptidase contained in yeasts, produces seasoning agent with high content of amino acids from soybeans, defatted soybeans, etc. 26.8.77 as 102894 (6pp43)

OHSA- ★ D16 34294B/18 ★ J5 4038-901

Cellulose- based pulp prodn. from algae - e.g. spirogyra, urothrix, corallina and tribonema, by treatment with acid, alkali, chlorine etc.

YK OHSAKA SEIKEN 30.08.77-JA-103960

F09 (24.03.79) D21c-03/02

Algae such as Spirogyra, Chaetophora, Urothrix, Corallina, Tribonema, etc. are used as the raw materials, and these are chemically treated with alkali, acid, chlorine, etc., to produce cellulose-based pulp.

The algae used as the raw materials can be easily cultivated in aq. medium from which the algae can be easily sepd. The cell wall of algae contains no lignin, and consequently, digestion with S-contg. chemicals is not necessary. Bleaching of the algae, pulp can be carried out by simple chlorine treatment, etc. 30.8.77 as 103960 (5pp173)

TAKE ★ D16 34319B/18 ★ J5 4039-001

Physiologically active material P-725 - inhibits prostaglandin biosynthesis and having antiinflammatory and analgesic activities

TAKEDA CHEMICAL IND KK 31.08.77-JA-105234

B04 (24.03.79) A61k-35/66 A61k-37/64 C07g-17 C12d-09/04

Substance P-725 having the following physical and chemical properties is new: (1) appearance, acidic lipophilic colourless pillared crystals or crystalline powder; (2) the pillared crystals change into needles at 140-160°C., and decompose at 165-170°C.;(3) elemental analysis: C 45.75± 0.5, H 4.45±0.5, N 8.94±0.5, O 41.22±1.0; mol.wt.157; mol.formula: $C_6H_7NO_4$; (4) $(\alpha)_D^{25}$ = +48.95±5° (c = 1.0, MeOH), (5) colour reaction: positive to iodine, Rydon-Smith and ninhydrin reactions; negative to naphthoresorcinol-H_2SO_4 reaction.

(6) Solubility: soluble in MeOH, EtOH, Me_2CO, MeCOEt, dioxane, EtOAc, alkaline water, and pyridine; readily soluble in THF, DMSO; sparingly soluble in PhH, Et_2O, $CHCl_3$, n-hexane, water and acidic water; (7) and has characteristic UV and IR spectra.

Substance P-725 is produced by a substance P-725 producing strain of Penicillium (Penicillium thomii IFO-7984) by cultivation pref. on a liquid medium with shaking or aeration and agitation at 20-35°C. for 1-12 days. 31.8.77 as 105234 (5pp52)

NORQ ★ D16 34531B/18 ★ J5 4040-136

Rearing mutant by tissue-cultivation of plants - without using e.g. radiation to induce mutation

NORIINSHO 25.08.77-JA-101134

P13 (28.03.79) A01h-01/06 C12k-09

Rearing mutant (based on the gene mutation generated during cultivation and the change of the chromosome structure) comprises tissue-cultivating one part of organ of plant such as seed, pollen, growing point, stem, foliage, petal or root or whole of plant such as young seedling, to dedifferentiate them and to restore the plant body.

The method gives the mutant in high yield, e.g. > 60%. In radial ray treatment, the mutation percentage is 20-40%. The method is safer and is more convenient, since it can induce the mutation without using e.g. radiation, 25.8.77 as 101134 (4pp)

KYOW ★ D16 34532B/18 ★ J5 4040-138

Large scale prodn. of begonia seedlings - by culturing pieces of plant tissue in solid then liq. medium

KYOWA FERMENTATION KK 07.09.77-JA-107391

P13 (28.03.79) A01g-01 C12k-09

Method comprises culturing tissue pieces of begonia plants in a solid medium until stems and leaves can be differentiated, and then culturing the resulting differentiated blocks in a liq. medium under shaking and stirring. This is opt. followed by culturing the resulting blocks in a solid medium.

Begonia seedlings are produced cheaply and quickly. The tissue may be e.g., leaf, stem, root, bud or other tissue. The solid medium cultivation is pref. conducted for 20-50 days, and the liq. medium cultivation is pref. carried out for 15-40 days. As medium there are used, e.g. White medium, Heller medium, Murashige-Skoog medium, etc. 7.9.77 as 107391 (4pp108)

Single-celled micro organism-contg. creams - separated fro fermentation liquors by centrifugeing heated and re-centrifuged improve solids content
BRITISH PETROLEUM LTD 19.03.74-GB-012101
*H04 (19.05.78) *DT2511-436 C12b-01/26*

A process is claimed for the sepn. of the biomass contg.
monocellular microorganisms obtd. in the fermentative
culturing of these microorganisms, the technique com-
prising centrifuging the fermentation broth to obtain a
concentrated biomass product, then heating the product,
5-70 (pref. 15-50)°C, and centrifuging again to further
increase the solids concentration of the biomass.

The process is used partic. with the culturing of yeas
(esp. Candida lipolytica or C. tropicalis) on hydrocarbo
substrate, esp. gas oil of boiling range 300-350°C (this
embodiment being specifically claimed), or kerosene.
Previous max. of 17 wt. % solids may be improved to 26 w
% in continuous and to 35 wt. % in batchwise processes.

The second centifuging temp. is esp. 75-80°C, the te
of the broth having been increased by 40-45°C. The pH
of the medium is 3-8 esp. 6-7 and the heating may be
carried out by blowing in steam or in a plate type heat-
exchanger. Jet discharge or decanter-type centrifuges
are suitable. The contact time of the microorganisms i

the heated environment should be minimised, e.g. to 0.1-5 min.

DERI- D16 26235W/16 =SU -611-595

Isolation of protease inhibitor from animal organs - by lysis with proteolytic enzyme and sepn. with cationic detergent

LAB DERIVATI ORGANI 05.10.73-CH-014265

*B04 (19.05.78) *DT2447-050 C07g-07/02 +C12d-13/10*

A protease inhibitor is isolated from animal organs by (a) subjecting the organs for a powder or extract thereof) to lysis with a proteolytic enzyme which does not attack the inhibitor; (b) terminating lysis by separating the protein; (c) separating the inhibitor by means of a cationic detergent; and (d) purifying the inhibitor. The process is simple gives high yields, and can be operated in combination with a standard heparin-isolation process.

In the combined process, stages (a) and (b) are effected above and the product is then separated in stage (c) into an insoluble fraction contg. heparin and mucopolysaccharides and an aq. liquid contg. the protease inhibitor; the heparin and protease inhibitor are then purified separately The animal organs can be lungs, parotid glands, pancreas and/or liver. The proteolytic enzyme must be one which is not inactivated by the inhibitor, e.g. papain, ficin, bromelain or pancreatin. Stage (c) can be effected by adding a protein precipitant and/or by heating. The cationic detergent is pref. cetylpyridinium chloride or cetyltrimethylammonium bromide. The inhibitor is pref. purified by acidifying the aqs. liquid with 2-5% CF_3COOH, adding $(NH_4)_2SO_4$ to 45-90% satn. fractionating with alcohol and/or acetone, and subjecting the product to gel filtration or gel chromatography.

Legume seeds coated with viable rhizobia bacteria - and a man-made caseinate salt

COATED SEED LTD 07.09.76-NZ-181956

A97 C03 (A11) (17.04.79) A01n-21/02 C05g-03/08

A legume seed is coated with viable rhizobia bacteria and with adhesive containing a man-made caseinate salt formed by reaction of casein with a salt-forming alkaline agent in solution. Additional materials may also be present in the coating.

The bacteria improve nodulation of the legume plants but they are susceptible to toxic exudates from the seeds. Incorporation of a caseinate salt in the coating, however, increases survival of the bacteria, probably by reduction of the toxic effect of the exudates. Also, the salt is a nutrient source for rhizobia. Further, the salt satisfies the major criteria for a good adhesive. 30.8.77 as 829096 (4pp476)

Detecting microorganisms in solution - by measuring signal across electrodes after elapsed time and detecting preset voltage change

NAT AERO & SPACE ADMIN 30.11.77-US-856460

J04 (17.04.79) C12k-01/04

The elasped time between inoculation and the release of H_2 produced by the presence of microorganisms in a nutrient solution is measured by an apparatus which includes a pair of electrodes which dip into the solution. One electrode is a standard pH reference electrode and the other is a platinum cathode between which a voltage is produced by the presence of H_2. A measuring circuit is inactive for 80 mins to allow the solution to stabilise after which the time to increase the potential of the electrodes by 10 mV is recorded.

The elapsed time recorder is then run backwards until the potential across the electrodes has risen by a further 20 mV after which it is halted and the resultant elapsed time is displayed.

The appts. detects the presence of microorganisms in a sample e.g. urine by measuring the time for the critica voltages to generated by the electrodes. It automatically ignores the state of the electrodes immediately after inoculation where unreliable results may be obtd. 30.11.77 as 856460 (5pp295)

nzymatic prodn. of maltose - using simultaneously-produced beta-amylase and alpha-1,6-glucosidase
AGENCY OF IND SCI TECH 11.01.74-JA-006465
*(D16) (19.05.78) *DT2500-597 C12d-13/10*
Process for the simultaneous prepn. of β-amylase and α-1.6-glucosidase comprises culturing microorganisms of the genus Bacillus in a bed and isolating the enzymes from the culture-bath. Also claimed is a process for the prodn. of maltose from starch or a starch deriv. using the simultaneously produced β-amylase and α-1,6-glucosidase to hydrolyse the starch. By producing the β-amylase and α-1,6-glucosidase simultaneously, one stage in the enzymatic prodn. of maltose is obviated.

Smoke stack for purifying waste gases - while simultaneously heating raw sugar cane juice
MORALES A J 06.10.77-US-839804
J01 (17.04.79) C13d-03
A smoke stack includes a smoke feed inlet at the bottom and a cleaned gas exit at the top. Raw cold sugar cane juice is fed into the stack just below the top to flow countercurrently to the rising gas. Two series of baffles are mounted in the stack, a first series of central baffles, and a second series of peripheral baffles, the series being staggered with respect to each other.

The first series of baffles comprises alternate circular and rectangular baffles. The inner edge of the uppermost peripheral baffle is in the vertical plane of the outer edge of the uppermost central baffle. The inner edges of the remaining peripheral baffles lie outside the vertical planes of the remaining central baffles.

The appts. is used to purify dirty hot waste gases while simultaneously heating the raw sugar cane juice. Also CO_2 in the gas clarifies the juice. 6.10.77 as 839804 (4pp295)

Purification of air - using clay pellets obtd. by calcining adsorbent clay contg. a powdery carbonaceous material
AKIYAMA T 29.08.77-JA-102740
E36 J01 (19.03.79) B01d-53/02

Method comprises calcining a spherical type insoluble clay of adsorbability contg. a powdery carbonaceous substance to obtain a sponge type adsorbing clay pellet, and contacting the clay pellet with the harmful air to remove the harmful components.

Partic., 100 pts. of a clay, e.g. zeolite, is mixed with 15 – 2 parts of a carbonaceous substance, such as, waste paper dust or wood dust, to obtain a mixt. The mixt. is shaped to a spherical substance. The spherical substance was calcined to obtain a spherical type adsorbing agent of 3-15 mm. of particle size. Air to be treated is passed through a bed of the spherical type adsorbing agent to remove SO_2, NO_2, NO, HCHO, and various bacteria. 29.8.77 as 102740 (3pp51)

KUSA/ ★ D22 33953B/18 ★J5 4037-087
Material for removing malodours e.g. from fish in a freezer - is prepd. by adsorbing amphoteric or nonionic surfactant on activated carbon pellets and rapidly cooling for dehydration

A97 E19 J01 P14 (19.03.79) A01l-09/ B01d-53/02*

Method comprises adsorbing an amphoteric or nonionic surfactant on active carbon pellets and rapidly cooling the obtd. active carbon to below -30°C. so it is dehydrated.

The amphoteric surfactant is a lauryl dimethyl betaine, stearyl dimethyl betaine, lauryl hydroxyethyl betaine, rhodium aminopropionate, sodium stearylaminopropionate, laurylamino diacetate, palmitylamino diacetate or N, N-di-(nonylbenzyl)-N-hydroxyethylamino acetic acid. The nonionic surfactant is polyethylene glycol lauryl ether, polyethylene glycol stearyl ether, polyethylene glycol cetylether, polypropylene glycol stearate, sorbitol laurate, sorbitol stearate, sorbitan laurate or sorbitan stearate.

In an example, 100 pts. wt. active carbon, 15 pts. wt. lauryl dimethyl betaine and 5 pts. wt. polyethylene glycol laurate were mixed. Compressed CO_2 gas was introduced into the mixt. for cooling to -40°C. to obtain dehydrated active carbon. 30.8.77 as 103139 (3pp51)

SANN ★ D22 34019B/18 ★J5 4037-188
Water absorbent resin prodn. - from amylase, addn. polymerisable monomers, and crosslinking agent
SANYO KK 29.08.77-JA-103925
A97 F09 (A11) (19.03.79) C08f-251

A mixt. essentially comprising (a) amylase, (b) >1 monomer with addn. polymerisable double bond which is water soluble or is rendered water soluble upon hydrolysis and (c) crosslinking agent, is polymerised and if necessary, is subjected to hydrolysis.

The ratio of the three ingredients is 100:10-1000:0.001-10. The polymerisation is pref. effected by irradiation or by using cerium salt or H_2O_2 catalyst. When necessary, polymerisation catalyst may be used. In this case, the polymerisation is effected at 10-150, pref. 20-100°C. The hydrolysis is done by the known methods in water or mixt. of water and alcohol in the presence of sodium hydroxide, potassium hydroxide, etc.

The resin can be readily produced at a low cost. It has a higher water absorbing power (> 60 ml./g., partic. 100 to 500 ml./g.) and is biodegradable. It is capable of forming stable gel when it retains water. When dry, it absorbs very little moisture in the air. The resin finds an extensive use in paper diaper, sanitary napkin, gauze, paper towel, etc. 29.8.77 as 103925 (6pp172)

Antithrombus material - comprising decomposition prod. of fibrin or fibrinogen on high mol. carrier
SUMI H 05.09.77-JA-106429
A96 P34 (28.03.79) A61m-01/03

An antithrombus material is obtd. by fixing a decomposition product of fibrin or fibrinogen on a high molecular carrier material.

A high molecular material is often used in the field of medicine. However, thrombus occurs when such a high molecular material is applied to the portion where it is in direct contact with blood in such an artificial kidney, an artificial blood vessel, an artificial valve, etc. A decomposition product of fibrin or fibrinogen is referred to in general FDP or FgDP and it is found to have antithrombus effect.

As the high molecular carrier, collagen, cellulose, agarose, nylon, polyester, polyamide, polystyrene, glass, etc. are used in a shape of tube, fibre, capsule, or film. 5.9.77 as 106429 (4pp30)

THAL ★ D23 33377B/18 ★BE -873-079

Separator for dividing water from organic solvents - used in the extn. of vegetable oils

VEB SCHWERMASCH THALMANN 27.12.77-SU-559842

J01 (17.04.79) B01d

The separator comprises a tank with a conical base with internal decanting element and tubes for the introduction of the mixt. The decanting elements consist of a thin bed formed into a continuous spiral bonded on the outside by the wall of the tank and in the centre by the central pipe through which run the inlet and outlet pipes for the coolant.

The introduction of the separator into existing installations guarantees an increase by 3 or 4 fold of the productivity without increasing the principal dimensions of the installation and improves the efficiency of purificn. almost threefold with a constant productivity. 27.12.78 as 873079 (17pp1330)

Fatty acid ester separation - into components of different melting points by modified hydrophilisation process

HENKEL KG AUF AKTIEN 30.10.70-DT-053257

*(26.04.79) *DT2053-257 C07c-67/48 C11b-03*

In an improved form of the continuous process for the separation of fatty acid ester mixtures, and esp. of triglyceride mixtures, the constituents of which have differing melting points, the conventional "re-wetting" technique is used. The starting mixture is converted into a dispersion of fluid and solid particles in an aqueous solution of a wetting agent, which may contain a non-surfactant electrolyte.

After centrifuging to divide the dispersion into a light fluid phase and a heavy phase, the solid particles are separated from the wetting agent solution. More than 10-70 wt.% of the wetting agent solution is drained away and replaced by water, wetting agent and possibly, electrolyte solution, before this is returned to the process. 30.10.70 as 053257 (11pp1045)

RAUW- ★ D23 33571B/18 ★DT 2747-765

Stabilisation of sodium percarbonate particles against moisture - by adding water mixing with silicic acid and drying
DEUTSCHE GOLD & SILBER 31.10.77-DT-748783
E34 (27.04.79) C01b

Sodium percarbonate contg. 1-10 wt.% water is mixed with highly dispersed silicic acid, then dried. The mean particle size of the silicic acid is pref. 2-100, partic. 7-20 mu. This yields sodium percarbonate particles coated with sodium silicate.

Sodium percarbonate is very unstable in the presence of moisture, and so cannot be used in untreated form in detergent compsns. The invention provides a way of giving sodium percarbaonte a coating contg. silicic acid which is simple to perform. The resultatn particles are stable to storage in a moist atmosphere. 27.10.78 as 871633 (8pp)

UNIL ★ D25 33373B/18 ★BE -871-714
Fabric softener compsn. - contg. complex of quaternary ammonium salt with one long chain and anionic surfactant
UNILEVER NV 31.10.77-GB-045254
E19 (30.04.79) C11d D06m

A dispersion in an isotropic aq. medium contains a cation (A) complexed with an anion (B). (A) is derived from a quat. ammonium salt which is a softening agent, and has a m.pt. $<$ 95°C. It contains one 12-24C straight chain aliphatic hydrocarbon radical, and forms a chloride with a Krafft point in water of $<$95°C. (B) is derived from an anionic surfactant contg. a 12-24C straight chain aliphatic hydrocarbon radical.

The ratio of normalities of (A) to (B) lies between 1.1:1 and 5:1. (A) and (B) together make up 2-15 wt.% of the compsn., which has a cloud point $>$ 95°C.

The compsn. is used as a fabric softener, which can be added during rinsing and after washing. Cationic surfactants contg. only one long hydrocarbon chain are more soluble than those contg. two, but suffer from the disadvantages of high aqueous viscosities, or phase separation. These problems are avoided by complexing with an anionic surfactant in the defined ratio. 31.10.78 as 871714 (25pp1331)

Mixed orthophosphate ester(s) prepn. - from phosphorus pentoxide, alcohol and poly:ol in defined ratio
HOECHST AG 07.10.76-DT-645211
*E11 H07 M12 (02.05.79) *BE-859-433 C07f-09/09*
Mixts. of acid orthophosphate esters are made by reacting P(V) oxide with an alcoholic component by mixing or kneading the oxide with a blend of or contg. a monohydric alcohol and 2-12C (cyclo)aliphatic polyol with 2-6(n)OH gps. at a molar ratio of 1: ≥ 2: ≥ 4/n.

The reaction is at 0-120°C with the exclusion of moisture, in the presence of an inert gas and over 1-6 hrs. The reaction prod. is cooled after this time.

Process avoids difficulties of sepg. prods. from aq. solns. 3.10.77 as 040976 (7pp974)

Cleaning compsn. e.g. for household baths - comprises surfactants and alkylene oxide adduct of aliphatic higher alcohol
NEW JAPAN CHEM 02.09.77-JA-105987
E19 (26.03.79) C11d-03/20
Cleaning compsn. for bathrooms, baths, washing machine etc. consists of several kinds of surfactants, and alkylene oxide adduct of aliphatic higher alcohol having iodine valu 20-80.

The compsn. has superior bath scum removability. Th amt. of the cleaning compsn. used is small. Pref. aliphatic alcohol is unsatd. higher alcohol prepd. from natural animal or vegetable oil by reducing with metallic Na, by hydrolysis, or by the selective hydrogenation. Other unsatd. higher alcohols, or a mixt. of the alcohols, are also usable when the iodine value is adjusted to 20-80. Pref. alkylene oxide is ethylene oxide, propylene oxide, or butylene oxide. Pref. adduct is an adduct of the alkyle oxide to the unsatd. higher alcohol having >11 HLB. The amt. of adduct is pref. >2 wt.% based on the amt. of the base surfactant. 2.9.77 as 105987 (3pp126)

Solid detergent compsn. with good lathering properties - contain N-long chain acyl acidic aminoacid salt and N-long chain açyl imin di:basic acid and/or its salt
KAWAKEN FINE CHEMIC 05.09.77-JA-106422
E19 (26.03.79) C11d-01/37
Solid detergent contains a base material consisting of ≥ salt of a N-long-chain acyl acidic aminoacid, and a modi er consisting of a N-long chain acyl imino dibasic acid a or its salt.

Pref. the acyl residue of the N-long chain acyl acidic aminoacid is a 8-22C (un)satd. fatty acid residue, and th acidic aminoacid salt is pref. aspartic acid salt, glutam acid salt, cysteic acid salt, or homocysteic acid salt. Pref. the salt is alkali metal salt, ammonium salt, wate sol. amine salt, or basic aminoacid salt.

Pref. the N-long chain acyl imino dibasic acid (salt) are of formula $RCON(R_1COOM)(R_2COOM')$, (where RCO is 8-22C (un)satd. fatty acid residue; R_1 and R_2 are each 1-3C alkylene and M and M' are each H, alkali metal atoms, ammonium gp., cationic residue of alkanolamine, cationic residue of basic aminoacid). Pref. the dibasic ac is diacetic acid, dipropionic acid or -3:3'-iminodibutyri acid. Pref. the amt. of the N-long chain acyl imino diba ic acid and/or the salt is 1-40 wt.% based on the amt. o the solid detergent.

The solid detergent has improved lathering property, smooth lathers, improved resistance to crumbling by dis solution, etc. It gives a soft and gentle feeling to the ski after washing. It is less irritative to the skin. 5.9.77 a 106422 (5pp126)

Clear liquid detergent composns
COLGATE PALMOLIVE CO 09.11.70-FR-040196 (09.03.70-FR-008310)
*(10.04.79) *BE-763-311 C11d-01/12*

Clear liquid detergent compsn. consists of(A) hydrosoluble sulphonated paraffins, (B) - higher hydrosoluble alkyl ether sulphates so that ratio A:B is 10:1-1:1, and (C) - a system for adjusting the viscosity and transparency of the detergent.

Pref. compsn. is 20-35 wt.% sodium sulphonate of a 13-18C paraffin 6-15 wt.% of a mixture contg. an 12-15C alcohol and $(NH_4)_2SO_4$ in the ratio 3:1, 0-6 wt.% of lauric and myristic acid monoethanolamides, 0.5-5 wt.% urea and 2-10% ethanol. 9.3.71 as 012247 (clg. 9.3.70; 9.11.70-FR-008310; 040196) C11d-1/12 (10.4.79) COLGATE-PALMOLIVE CO. (6pp) (J46002331)

DICK/ ★ D25 35104B/18 ★US 4149-986
Long lasting toilet bowl cleaner - contg. sodium sulphate, urea, nonionic surfactant, sodium stearate and dye
DICKSON D J 03.11.77-US-848108
A97 E19 (E34) (17.04.79) C11d-03/04 C11d-07/10 C11d-09/30

Toilet bowl cleaner comprises (by wt.) 50-60 (55)% Na_2SO_4; 17-24 (23)% urea; 8-20 (10)% nonionic prim. alcohol ethoxylate surfactant (I); 8-11 (10)% moisture; 0.25-2 (0.4)% Na stearate and 1-2 (1.3)% water-sol. dye. The compsn. pref. also contains minor amts. of silicone and methyl salicylate.

The compsn. has a longer life than known compsns. since, because the density is greater, 13 ounces can be accommodated in a standard 9 ounce container. The proportion of expensive (I) can be reduced without loss of cleaning effect and since liq. rather than waxy (I) are pref. mfg. time and energy costs are lower. 3.11.77 as 848108 (3pp1251)

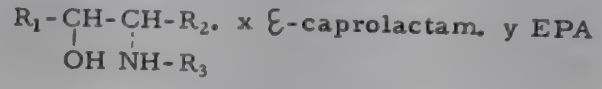
UNIL ★ D25 35109B/18 ★US 4150-001
Detergent bar contg. alkaline earth metal hydrogen orthophosphate and sodium alkaline silicate to reduce sogginess
LEVER BROTHERS CO 26.05.77-US-800773
E33 (E12 E34) (17.04.79) C11d-03/06 C11d-17

Detergent bar comprises (by wt.) 15-65% active detergent components; 5-60% builder; 1-40% $XHPO_4$ (X=Ca and/or Mg), 5-30% Na alkaline silicate and the remainder conventional detergent ingredients. Pref. $XHPO_4$ is $\geqslant$ 5% and he active detergent is a water-sol. salt of a 8-20C linear alkyl benzene sulphonate.

Addition of $XHPO_4$ reduces sogginess during use and storage, and reduces the time necessary between mixing and stamping to, e.g. Y_2 hr. The silicate assists $XHPO_4$ in providing a bar of improved hardness and reduces sogginess. 26.5.77 as 800773 (4pp1251)

HENK D25 57076A/32 =US 4150-024
Detergent compsns. esp. for cold-washing textiles - contain surfactant(s) and opt. oxyalkylated reaction prods. of epsilon-caprolactam and vicinal hydroxyalkyl-amine
HENKEL KG AUF AKTIEN 02.02.77-OE-000666 (17.12.76-DT-657193)
*E13 P34 (17.04.79) *DT2752-658 C07d-223/10*

Reaction prods. of ε-caprolactam with vicinal hydroxyalkylamines and possible adducts with epoxyalkanes have formula:



$$R_1-\underset{OH}{CH}-\underset{NH-R_3}{CH}-R_2.\ x\ \varepsilon\text{-caprolactam.}\ y\ EPA$$

(where R_1 and R_2 are H or 1-16C alkyl provided that the sum of the carbon atoms in R_1 and R_2 is from 6 to 30 when R_1 and R_2 are alkyl and from 6 to 16 when R_1 or R_2 is H. R_3 is H, 1-5C alkyl and $(CH_2)_m-NR_4R_5$ where m is an integer from 2-10, and R_4 and R_5 are H and 1-3C alkyl. EPA is an epoxide selected from ethylene oxide, propylene oxide and glycide, x is 1-5 and y is 0-5. The reaction prods. and their salts are useful as antimicrobials in the treatment of aq. media and in detergents together with other surface-active cpds. 14.12.77 as 860552 (16pp)

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

D1: FOOD; FERMENTATION

D11 : BAKING

BOSC D11 48010A/27 =DS 2658-686
Baking oven with hot-air fan - has switch connecting grill in series with fan heater
BOSCH-SIEMENS HAUSG 23.12.76-DT-658686
*Q74 R59 (03.05.79) *DT2658-686 A21b-01/26 F24c-15 H05b-01/02*

Domestic oven with hot air circulation for use in unfreezing, roasting, grilling and baking includes in the circuit for the air heater and the grill heating element a temp. controller upstream of the main switch. The branch circuit for the grill heating element has a safety temp. limiter which can be connected in series with the temp. controller. The latter can be shunted by a switch for a pure grilling operation.

Simple method is provided for operating the oven for its different purposes. The safety temp. limiter prevents overheating of the muffle. A third element can be added to provide bottom heat for baking. 23.12.76 as 658686. (4pp39)

ABER/ D11 04335B/03 =DS 2731-025
Healing herb extract-contg. bread prepn. - prepd. using herb extn. in medium contg. fermentation acid, or salt, e.g. natural leaven
ABERHAM H 08.07.77-DT-731025
*(03.05.79) *DT2731-025 A21d-02/36*

A plant bread is made contg. e.g., mistletoe, hawthorn, parsley or horseradish. The plant is allowed to swell in a 0.1-1.5 molar soln. of lactic, citric, acetic or tartaric acid or their alkali(ne earth) salts.

The resulting soln. is added to bread dough, which is then baked in the normal way. The bread has health-giving properties. 8.7.77 as 731025. (3pp068)

WERN ★ D11 35447B/19 ★DS 2829-937
Air circulation baking oven - with two ventilators revolving in same direction and flow reversal by flap valves
WERNER & PFLEIDERER 07.07.78-DT-829937
(03.05.79) A21b-01/26

A baking oven is equipped with two circulation ventilators which rotate continuously in the same direction. Distributor ducts on both sides of the baking space are equipped with flap valves by which the hot air flow through the baking space can be reversed. A cross channel joins the two delivery ends of the ventilators.

This saves power losses caused by a reversal of the ventilators and prevents overheating of the heat exchanger during reversal. The design results in a smaller overall height and in good thermal and circulating efficiency. 7.7.78 as 829937. (4pp39)

WINK ★ D11 35578B/19 ★DT 2748-959
Dough dividing machine - includes rotating drum having dough portioning chamber from which dough is ejected onto conveyor
FR WINKLER KG 02.11.77-DT-748959
(03.05.79) A21c-05/04

A dough dividing machine has a revolving drum with a dough portion chamber having a cam-controlled piston in it. The discharge belt conveyor is arranged above this drum and contacts the drum tangentially with its feed end. The discharge position of the portion chamber is tilted upwards relative to the filling position.

This provides the optimum discharge height for the dough portions for further processing and ensures good access to the dough funnel. The dough is not kept pressurised during the whole time of its retention in the drum so that its raising properties are not affected. 2.11.77 as 748959 (19pp39)

WINK ★ D11 35588B/19 ★DT 2748-988
Dough dividing machine ejecting several portions simultaneously - works without complicated and expensive cam operated ejecting levers
FR WINKLER KG 02.11.77-DT-748988
(03.05.79) A21c-05/04

The dispensing chamber cylinder of a dough dividing machine pivots between a filling and an ejecting position, and has one or more dispensing chambers in each of which there is a radially displaceable piston.

In the filling position, a piston presses the dough into the corresponding chamber. The dispensing chamber piston is free to move in the chamber, and inside the hollow of the dispensing chamber cylinder, there is an adjustable measuring stop which limits the inwards motion of the dispensing chamber piston at the predetermined full point. A fixed ejector stop is also provided which, in the zone of the ejecting position, makes contact with the dispensing chamber piston along a curved end face determining the ejection stroke.

Arrangement is partic. useful when a number of dispensing chambers are arranged along a mantle line of the dispensing cylinder, for the simultaneous ejection of dough portions for rolls, etc. The cam controlled levers of conventional machines are very expensive to install and maintain. The present design is much simpler and completely efficient. 2.11.77 as 748988 (16pp1045)

ALTO- ★ D11 35619B/19 ★DT 2842-011
Piercing machine for English muffins forming sawtooth tear - is easily and quickly rendered inactive and energised again
ALTO CORP 01.11.77-US-847662
(03.05.79) A21c-15/04

In a machine frame through which English muffins are transported on a conveyor from the inlet to the outlet, two endless chains run alongside the conveyor, in the same direction and at the same speed. The chains support carriages each of which holds a set of sharp lances and as the carriages move forward, the lances are made to project at right angles to the conveyor. Alongside the conveyor also there is a first curved camplate. This is positioned between the conveyor and the path followed normally by the lance carriages. This plate is fixed solidly to the frame whilst a second curved camplate, outside the first, can be displaced between a retracted position away from the normal path of the lance carriages, and an advanced position close to the first camplate and in the normal path of the carriages.

The yielding guide surfaces of the camplates opposed to each other act on the carriages so that in the advanced position of the second plate, its guide surface engages with a cam follower on the carriages as they are moved by the chains, and the lances penetrate the muffins on the conveyor. The cam followers are then engaged with the guide surface of the first camplate, and the lances are withdrawn. On the frame aligned at right angles to the curved camplates and the conveyor, an adjusting mechanism is provided, so that the second camplate on each side of the conveyor may be moved to its advanced or to its retracted position, and the machine delivers as required, pierced or plain muffins. 27.9.78 as 842011 (27pp1045)

PENN D11 38025X/20 #GB 1545-320
Dough improver compsn contg oxidising agent - and pref azodicarbonamide with edible salt hydrate to reduce fire hazard
PENNWALT CORP 17.05.74-US-470767 (06.04.76-GB-013953)
*E16 (E33 E34) (10.05.79) *US3954-999 A21d-02/02*

A powdered additive for improving flour and dough comprises in admixture a strong flour oxidising agent, an org-

anic flour or dough improving agent, and an edibly accept-
able, hydrated salt which is inert with respect to oxidising
and improving agents.

The proportion of hydrated salt is sufficient to provide
in additive 15-50 pts. wt. of water, per 100 pts. wt. of
oxidising agent, and to yield a mixt. having Tranzl numb-
er <40. Pref. oxidising agent is alkali(ne earth)metal
bromate, iodate, chlorite, periodate or peroxide.

Handling properties of flour and dough are improved, as is the quality of bread and other bakery prods. prepd. from them. 6.4.76 as 013953 (5pp931).

BREA- D11 83776A/46 =GB 1545-552

Oven heated by circulating air - with air flow pattern altered by pivoting flaps depending on size of item baked

BREADCO SERVICES L 08.06.76-GB-023613

*Q74 (10.05.79) *US4124-016 +A21b-01/26*

Oven for baking bread prods. has a chamber supplied with heated air through horizontal slits in opposite side walls of the chamber. The oven may be converted for making prods. of different size by pivoting swivel brackets mounted in the oven adjacent selected horizontal slits between positions in which the adjacent horizontal slits are closed and positions in which the slits are open. Additional trays may be supported in the oven chamber adjacent the selected horizontal slits. 8.6.76 as 023613 (10pp1363).

ORIY ★ D11 36013B/19 ★J5 4041-343

High quality bread mfr. - using dough contg. wheat flour, L-ascorbic acid and sucrose fatty acid ester as a substitute for potassium bromide

ORIENTAL YEAST KK 05.09.77-JA-105899

(02.04.79) A21d-02/22

The dough contains an agent (I), composed of 100 pts. wt. wheat flour, 5-100 ppm. L-ascorbic acid and 0.005-1 pt. wt. sucrose fatty acid ester of HLB >10, pref. 11-15.

(I) pref. contains calcium stearate, enzyme of Koji and/or lecithine. (I) is mixed with the usual raw materials of dough, such as sugar, salt shortening, etc. 5.9.77 as 105899 (8pp42)

KOMI/ ★ D11 36018B/19 ★J5 4041-362

Glutinous rice cracker prodn. - by freezing starch material, thawing it and mixing it with rice

KOMIYA Y 01.09.77-JA-105696

(02.04.79) A23g-03

The method comprises (1) freezing the starch-material paste, such as sweet potato starch or sake lees, for 1 night, (2) thawing it and (3) mixing it with rice.

A cracker having good texture can be p
large amts. of starch material. By freezing and thawing
the starch material, amylopectin and amylose are sepd.
and the texture of the cracker can be improved. 1.9.77
as 105696 (3pp42)

VENZ/ ★ D11 36910B/19 ★US 4150-935

Appts. for automatically cutting and rolling cannoli - from rolls of laminated dough, carried on conveyor and spirally wound on cylindrical former

VENZO D 26.07.76-US-708879

(24.04.79) A21c-09/08 A21c-11/10

Appts. comprises a conveyor belt which receives strips of dough diagonally inclined to the axis of the belt. The belt includes a first section spaced from a lower second station by a vertical step defined by rolls. At this step is located the cannoli forming station where the dough strip is guided onto a cylindrical metal former which rotates to wind the strip spirally onto it.

A set of three rollers presses the dough onto the forme during rotation and in addition a further roller presses the downstream end of the dough into the remainder to provide adhesion.

Different shapes of cannoli canbe formed by altering the diagonal angle of the dough on the conveyor, by substituting conical formers for cylindrical or by reciprocating the former during the winding. 26.7.76 as 708879 (8pp295).

GENM ★ D11 37090B/19 ★US 4151-307

Doughs contg. starch prods. and tempeh - for preparing high protein, low fat fried snack foods

GENERAL MILLS INC 02.12.74-US-528601

*(24.04.79) A23l-01/**

The known process of prepg. a fried snack prod. in which a dough is prepd. from a starch-contg. material (I) (cereal flour, cereal starch, potato flour, potato starch, or mixts.; a portion as pregelatinised starch), the dough is shaped and then the shaped pieces are deep fat fried is improved by using a dough contg. 5-60% by wt. of tempeh (II).

Incorporation of (II) (a fermented soybean prepn.) into the above dough affords crisp, fried prods. which possess increased protein content and reduced fat content. 2.12.74 as 528601 (3pp478).

FRAN/ ★ D12 35307B/19 ★DL -134-041

Fish filleting machine guide element - with springy rods of different length and adjustment strap for free length

FRANK H 07.12.77-DL-202446

(07.02.79) A22c-25/08

The guide element is arranged on both sides of the flank cutters to which the fish are fed by endless conveyors, acting on the sides, as they slide on ventral cavity slideways. The guide element is composed of an array of rods of different length which can deflect independent of each other. These rods are clamped between two parallel straps at one end and can be adjusted as regards their gradient. An adjustment clip across them can be used to make the freely deflecting ends of the rods smaller when smaller fish have to be filleted.

These rods exert a differential pressure against the fish on the slideways and keep the fishbones parallel to the cutter plane. 7.12.77 as 202446(6pp39)

NMHB ★ D12 35308B/19 ★DL -134-0

Fish skinning machine - has retractable catch face above cuttir blade ZA 30.1.79)

NORDISCH MASCH R BAADER 20.03.78-ZA-001596 (22.02.7 DL-203800)

(07.02.79) A22c-25

A skinning machine for fish (fillets) has on the rear face of the skinning blade near its cutting edge a slider with a catch face of 2-6mm wide. Springs enable the slider to move in the direction of movement of the fish.

A steady run-in of the skin is ensured so that the blad can sever the tendons and ligaments between skin and meat. 22.2.78 as 203800(13pp39)

NODH D12 15004U/11 =DS 2222-205
Shaped frozen food - extruded in a variety of shapes for eg fish fingers and steaklets
NORDSEE DEUTSCHE HO GMBH (UNIL) 05.05.72-DT-222205
*P71 +Q75 (03.05.79) *NL7211-775 A23b-04/06*

Deep frozen fish or meat are extruded, in the case of fish to fish fingers, through a nozzle in a pressure-tight channel at below -6°C and at > 100 atmos. The deep frozen material is pressed into this channel which has a cross-section with a convergence of 1.1-3:1 (pref. 1.3-2:1), followed by a constant cross-section.

The structure of the fish or meat is preserved and distortion of the emerging strand is prevented. Portions, cut off to the same length, always have the same weight. 5.5.72 as 222205. (5pp39)

NMHB ★ D12 35445B/19 ★DS 2804-232
Fish processing conveyor - with gripping valves on twin V/belts
NORDISCH MASCH R BAADER 01.02.78-DT-804232
(03.05.79) A22c-25/08

An endless conveyor for a fish processing machine consists of two V-belts, running side-by-side, each with a ine of gripping halves. Above the processing section of he machine, these halves are supported on the outsides by guide rails which urge the gripping halves against a eading bar between them.

This facilitates the adjustment of the conveyor to fishes of different size and gives a greater freedom for additional tools and guides. 1.2.78 as 804232. (4pp39)

GASP/ ★ D12 35532B/19 ★DT 2748-445
ieve plate in filling line of sausage machine - can be cleaned without necessity of dismantling the machine components
GASPAR T A 27.10.77-DT-748445
(03.05.79) A22c-11/02

ieve arrangement fitted between the meat store and the lling socket of a sausage filling or making ma chine, is ormed by a tube penetrating the filling pipe at right angles. nside the tube, a sieve plate, also aligned transversely to e axis of the filling pipe extends the full length of the ross tube. At each end, the sieve plate is provided with etachable fastening covers.

The sieve holds back hard fragments of bone, cartilage, inew, etc., preventing harm to the consumer and allowing greater quantity of edible matter to be derived from the aterial available. It is of simple design. The device ay also be used for cleaning mince, etc. for hamburgers, eat balls and so on. 27.10.77 as 748445 (12pp1045)

EYS- ★ D12 35699B/19 ★DT 2847-286
ensified frozen, meat-fibre slices with surface grooves - simulate arcoal-grilled steaks with light and dark bands
KEYSTONE FOODS CORP 01.11.77-US-847674
(03.05.79) A23l-01/31

slice or plate of densified, frozen, meat particles has, ≥1 of its surfaces, equally spaced grooves. The grooes are sepd. by lands which define the surface of the ate. The grooves are straight and parallel. They run ross the length of the plate from one edge to the other. e pitch of the grooves is equal to the pitch of the rods of charcoal gridiron.

Used to help satisfy the demand for charcoal-grilled eaks, for which only a small amt. of the meat from ch beast is suitable and which are relatively expensive. e prod. has the definite characteristics which are assiated with charcoal-grilled steaks without the unchewab- cartilage, sinew, etc., and is able to reach the mass arket with a quickly prepd. dish. 31.10.78 as 847286 8pp)

PP ★ D12 36015B/19 ★J5 4041-355
aintaining freshness of raw meat - by packing with oxygen-moving agent in oxygen impermeable film and refrigerating
TOPPAN PRINTING KK 07.09.77-JA-107521
(02.04.79) A23b-04/06

w meat is maintained fresh by packing with O_2-removing ent composed of chloride of Mn or Fe Gp. metal, basic d., sulphite and suitable additives, in O_2-impermeable m tightly, and refrigerating.

The red colour of the meat such as beef, pork and horse meat, and red fish meat, such as fluefin and bonito, arises from oxymyoglobin which is produced by oxidn. of myoglobin. Process converts instable oxymyoglobin to stable myoglobin by packing in the absence of O_2. 7.9.77 as 107521 (3pp42)

KONG- ★ D12 36016B/19 ★J5 4041-356
Synthetically coloured meat - prepd. by curing raw meat with a nitrite and a salt-resistant lactic acid bacteria
KONGO KK 08.09.77-JA-108107
(02.04.79) A23l-01/31

The meat (I) is prepd. by curing raw meat (II) with nitrite (III) and salt-resistant lactic acid bacteria (IV).

As (IV), Lactobacillus acidophilus, L.plantorum, L. bulgaricus, L.delbrueckii, Streptococcus lactie, St. cremoris and St. faecalis are used. (IV) is identified by the following test: (a) the pH of the milk- culture medium should be <5.0, after incubation of 1 g. of (IV) at 38-40°C. for 48 hrs.; (b) when 1 g. of (IV) is incubated in 500 ml. of 1%-lactose bouillon-medium at 38-40°C. for 48 hrs., 5 ml. of the medium is diluted to 10 ml. and it is titrated with 0.02 N-NaOH, >5 ml. of the NaOH soln. should be consumed.

(III) had been used for colouring (I) and the use of (III) was prohibited as (III) is a carcinogenic substance. The amt. of (III) in (I) can be reduced when (III) is used with (IV). 8.9.77 as 108107 (4pp42)

Dried Euphausia pacific prodn. - by steeping in aq. soln. of e.g. fatty acid glycerine ester, pressing and drying
KYOWA HAKKO KOGYOK 22.07.75-JA-088819
*(18.04.79) *J52012-948 +A23b-04/04*

Euphausia pacific is steeped in an aq. soln. contg. 0.04-0.3% of glycerine ester of a lower fatty acid (e.g. monoglycerine ester of caproic ester), 5-20% of sorbitol, 0.5-10% of propylene glycol and/or 2-10% of glycine and opt. sodium glutamate and common salt. The obtd. Euphausia pacific is pressed and dried to moisture content of 15-30%.

The steeping time is 15-60 min. when Euphausia pacific is employed as it is. The steeping time is 5-30 min. when mashed Euphausia pacific is empolyed. 22.7.75 as 088819A23b-4/04 (18.4.79) KYOWA HAKKO KOGYO K (NISU-) (9pp) (J52012948)

AZOV= ★ D12 36490B/19 ★SU -496-028
Fish filleting machine - has centering grippers and conveyor, abdominal cavity opening knife and cleaning brushes
AZOV BLACK SEA FISH 12.07.71-SU-676227
(05.06.78) A22c-25/14

Fish filleting machine comprises a conveyor having supporting magazines and centering grippers, a disc knife to remove the head from the abdomen side, support strip to limit the depth of cut and fixing the fish in position, and an abdominal cavity opener and cleaner, comprising curved knife and brushes. The opening-up quality is improved and tearing of the body in the region of the shoulder bones is prevented, by placing a spring-loaded oscillating profiled bottom plate inside the centering grippers of each magazine. A disc knife is fastened to the ripping and cleaning shaft at the point of the curved knife. This disc knife rotates about its own axis, so that the abdomen is cut from the anal opening and from behind the head simultaneously.

Animal hides cleaning installation - has belt and chain conveyors and blades shafts past which hides travel while being sprayed with water
GIMELFARB N M 21.05.74-SU-027194
(10.11.78) A22b-05/08 C14b-01/04

Installation for hygienic processing of hides, e.g. in the meat industry, has mechanisms to supply and move the hides, shaft with blades to clean the hides, mechanism to press the hides to the bladed shaft, douching device, and withdrawal conveyor. Hide quality is increased by making the main feeding mechanism as two belt convey-

ors with a gap between them, and a pair of chain convey-
ors. One of the latter is in the gap between the belt con-
veyors and the other is above it. The links of the upper
chain have rubber shock-absorbers, and the links of the
lower are catch-shaped plates. The bladed shafts are on
both sides of the chain conveyors and at an angle to their
longitudinal axis.

Single-operation fish-filleting machine adjustment device - has two-armed brackets to measure fish length and signal to circuit controlling cutting attachments
FAR-E KUIBYSHEV POL 13.11.74-SU-075891
(01.06.78) A22c-25/14

The proposed system is used to adjust the working unit in
a single-operation fish-filleting machine, depending on
the length of the fish, as they are arranged on the convey-
or at right angles to the motion. An attachment to meas-
ure the fish length consists of rotating two-armed brack-
ets fixed parallel to one another above the conveyor, for
probing the lower ends of the fish. This is accompanied
by a measuring arm, executive mechanism, and control
system made up of a memory unit, stepping motor, photo-
sensors, disjunctor, commutators and amplifier connec-
ted to the stepping motor. A pulse generator and distri-
butor are connected together.

Productivity is increased, by providing an additional control system for the executive mechanism, the construction of which is similarly based. The input of this extra system is connected to the photoelectric sensors, and the output of each system is controlled by a disjunctor connected to the input of the commutator.

eoxygenating agent - comprising iron powder contg. iron carbide, . salt soln. and hydrogen adsorbent sealed in bag

DIA CHEMIFA KK 07.09.77-JA-107531

E36 G04 (02.04.79) A23l-03/34 B01d-53/16

eoxygenating prod. is mfd. by sealing deoxygenating agent mprising as effective ingredients Fe powder contg. Fe rbide and aq. salt soln. in an air-permeable bag, togeth with H_2 adsorbent. The air-permeable bag is in turn aled in an air tight bag.

In an example, 1 g. of cast Fe contg. C as a ~3% 0.15 g td. NaCl soln. and 0.85 g. diatomaceous earth were apped in air-permeable bags, which were packed in heretic bags in combination with the adsorbent coated with lecular sieve. The prod. was suitable for treating food ods. 7.9.77 as 107531 (2pp43)

SO ★ D13 36011B/19 ★J5 4041-340

odstuffs additive for controlling pH - comprises sodium malate d malic acid added during processing, giving improved storage operty

FUSO KAGAKU KOGYO K 06.09.77-JA-107432

(02.04.79) A23l-01

dium malate and malic acid are added to foodstuffs dur g processing stage to adjust pH value. pH value of foodtuffs such as noodles, pickles, etc., is adjusted without maging the properties of the foodstuffs. The ratio of dium malate and malic acid is adjusted, and generally alic acid is used in an amt. of 0.03-1.40 wt. part relave to 1 pt. of sodium malate.

In an example, when 50 kg. of flour, 1.6 kg. of table lt and 15.1 kg. of water are blended to give noodle and noodle is boiled in 600 l. of water, 1034 g. of sodium malate and 166 g. of malic acid are added to this 600 l. of water to adjust pH 5. Thus prepd. boiled noodle can be stored, after heat-sterilisation treatment, for 32 hrs., and after H_2O_2-sterilisation treatment, for 44 hrs. 6.9.77 as 107432 (4pp22)

Controlling properties of foodstuffs etc. - using sodium malate, malic acid and a phosphate

FUSO KAGAKU KOGYO K 06.09.77-JA-107433

(02.04.79) A23l-01

Sodium malate, malic acid and phosphate are added to foodstuffs during processing to adjust its pH without damaging the properties of the foodstuff, such as noodles, pickles, etc. Generally, the amt. of sodium malate is 30-95%, malic acid is 65-5%, and phosphate is 20-5%.

In an example, when 50 kg. flour, 1.6 kg. table salt, and 15.1 g. water are blended to noodles, which are boiled in 600 l. of water, 750 g. sodium malate, 158 g. malic acid and 200 g. sodium metaphosphate are added to the water to adjust the pH to 5.2. The prepd. boiled noodle can be stored, after heat-sterilisation, for 36 hrs., while boiled noodle contg. no additives can be stored for only 24 hrs. 6.9.77 as 107433 (5pp22)

Prodn. of pickle - by mixing seasoning and grated Japanese radish, and pickling

ZENKOKU TSUKEMONO K 02.09.77-JA-105625

(02.04.79) A23b-07 A23l-01/21

The pickle (I) is produced by pickling Japanese radish (II) in a mixture, which is prepd. by mixing seasonings and grated (II).

The amts. of sweeteners, seasonings and other reagent consumed can be reduced by 40%. Amino carbonyl reaction and change in quality by increase of sundry germs hardly occur. Bleaching of (I) is not necessary, and (I) has good appearance. 2.9.77 as 105625 (3pp42)

NIHA- ★ D13 36017B/19 ★J5 4041-360

Strengthening agent for coating egg-shells - prepd. by mixing inorganic powdered cpd. e.g. calcium sulphate, wax, paste e.g. of gum arabic and solvent

NIPPON HAIGO SHIRYO 09.09.77-JA-107970

(02.04.79) A23b-05/06 A23l-03

Agent (I) for coating on eggshell, prepd. by homogeneously mixing inorganic powdery cpd. (II), wax (III) and paste (IV) in a solvent (V). (I) is used for strengthening and preventing change of quality of egg. By coating (I) on eggshell breakage can be reduced and weight-decrease, decrease of content of egg-yellow and/or protein in egg and generation of mould are prevented.

Typically, (II) is Ca sulphate, Ba sulphate, Mg sulphate, talc etc. (III) is rice bran wax, carnauba wax, candelilla wax, vinyl acetate, cotton oil etc. (IV) is gum arabic, guar gum, Na polyphosphate etc. (V) is ethyl alcohol, propylene glycol, hexan, acetone, etc. 9.9.77 as 107970 (3pp42)

WARN ★ D13 36019B/19 ★J5 4041-364

Chewing gum compsn. with no sucrose and/or glucose - comprises gum base, sorbitol, mannitol, stevioside, gum arabic and flavouring

NIPPON WARNER LAMBE 09.09.77-JA-108620

A97 (02.04.79) A23g-03/30

Compsn. (I) for chewing gum, comprises 20-40 wt.% gum base, 2-60 wt.% sorbit, 2-60 wt.% mannit, 0.95-5 wt.% stevioside, 1-20 wt.% gum arabic and 1-5 wt.% flavouring cpds.

Gum arabic is pref. used as either a powder or soln., and when used as a powder, the particle dia. is smaller than 100 mesh. Pref. as gum base, carnauba wax and synthetic gum, e.g., vinyl acetate, polyisoprene, are used. An extending agent e.g. calcium carbonate, an emulsifier, e.g. glycerol and a softening agent, e.g. dibutyl phthalate may be added to (I).

(I) is for a chewing gum contg. no sucrose and/or glucose, and so the gum does not cause dental problems. 9.9.77 as 108620 (2pp42)

An improved process for producing e. g. chocolate and tablet-like candy involves substituting part or all of the usual sugar material with β-lactose.

The degree of substitution is decided freely according to the required sweetness of the prod.

The method of this invention is suitable for the prodn. of candles without the addn. of water. 19. 6. 75 as 073647 A23g-1/00 (18.4. 79) MORINAGA CONFECTION KK (5pp) (J51151373)

Soured cream having gel consistency prodn. - by two/stage souring of pasteurised cream with lactic flora with subsequent two/stage thermal treatment
LITOVSK BUTTER CHEE 17.04.70-SU-423758
(12.04.76) A23c-13/12

The soured cream is produced by pasteurising fresh cream, homogenising, cooling to the souring temp. introducing a lactic flora bacterial culture, souring to an acidity of 25-30°T, and additionally souring to 65-80°T at a temp. below 10°C (e.g. 8-9°C).

The quality of the product is improved by [illegible] after the additional souring, in two stages (below and above 15°C respectively) with an interval (at least 10 mins) during which the soured cream is poured into containers (the aim of the first stage heating is to temporarily diminish the viscosity of the product).

Storage stable protein-fat concentrate powder prodn. - by mixing animal fat aq. emulsion with animal blood and spray drying for use as feed additive for animals and poultry
GORYAEV M I 08.05.73-SU-915986
C03 (09.06.76) A23k-01/10

Production of emulsified fat concentrates, for use as feed additives for animals and poultry, is improved by mixing a fat emulsion with animal blood and drying the mixt.

By this method a protective proteinaceous coating is formed on the fat particles so that the product has improved storage stability. It does not cake. The aroma and colour are preserved. The product can be easily handled and mixed with animal feed.

Soybean protein extracts - contg. protein and oil, having extended shelf life
THE ANDERSONS 07.06.77-US-804356
(24.04.79) A23j-01/14

Soybean protein extract contg. ≮ 55% soybean protein (I)
(dry solids basis); 2-32% natural soybean oil (II) ((I) and
(II) obtained together but readily separable by solvent
extrn.); carbohydrates, minerals; and edible proteinate
salts of (I) is prepd. as follows: (a) soybeans are dry
ground to finer than 70 mesh (US Sieve), then slurried wi
aq. alkali (pH ≮ 8) to solubilise (I) and afford aq., oil,
and insol. solid phases; (b) aq. and oil phases are sepd.
from the insol. solids; and (c) aq. phase is sepd. from th
oil phase by centrifugation and the aq. is then adjusted to
pH 4-5 to ppt. the title extract. (alternatively pH may be
adjusted before centrifugation.).

Prepd. protein extract has extended shelf life even
though it contains ≮ 2% oil. This is because the extrn.
system used preferentially removes 'free oil', leaving
only 'bound oil' (not readily oxidised) with (I). 7.6.77
as 804356 (4pp478).

air as batch on reversible conveyor enters pressure vessel**
COUDERT J SA 28.10.77-FR-032608
Q31 (03.05.79) A23l-03/08 B65b-55/19

Before their packagings are sealed, foodstuffs are ster
ised in an installation including a vacuum chamber, to
ich a steam sterilising vessel and an arrangement for h
meti cally sealing the packagings are joined.

The equipment comprises (a) a pressure vessel con
-ed to a steam line, a pressurised water line and a vac
m pump; (b) storage elements for the filled packagings
the pressure vessel; (c) a channel connected to the pre
ure vessel by a gate valve, the dimensions of which su
those of the packagings; (d) connections joining the cha
el to the steam supply; (e) conveyors for transferring
packagings to be sterilised from the channel to the sto
equipment in the pressure vessel, and returning the st
ilised packagings into the channel; (f) a device for her
tically closing the sterilised packagings in a chamber
nected to the inlet of the channel; and (g) a conveyor d
vering the sterilised and sealed packagings from the c
mber.

The process can be carried out in an economic man
and requires the minimum of time, since it is carried
in open packagings. The prod. can thus be exposed to
vacuum, to extract the air, and heat can be applied un
rmly and quickly in the inside of the container. 27.10

Coffee brewing apparatus with hot water generator - mounted on channel crossing access opening to plastic housing
GENERAL ELECTRIC CO 17.05.78-US-906861
(24.04.79) A23f-01

An electric brewer for coffee comprises a heated base supporting a receptacle and a hot water generator. The heated water is directed from the generator to the receptacle. The generator is mounted in a single moulded plastic housing with an access opening only at one end.

Spaced ribs are formed on the inside of one of the side walls and terminate within the access opening. A securing device is formed on the opposite wall. A U-shaped channel member crosses the access opening with its legs directed nto the opening. The member is fixed against the ribs at one edge and is connected to the securing device at the other edge. The generator is secured to the channel to ix it against all lateral movement and movement into the opening. 17.5.78 as 906861 (4pp295).

ZILL- D14 21908A/12 =US 4150-611
Machine to continuously stone and halve fruits esp. peaches - has automatic loader and positioner to replace two operators
ZILLI & BELLINI 10.01.77-IT-046801 (04.06.76-IT-046865)
*(24.04.79) *FR2353-237 +A23n-03/08*

A continuous halving and destoning machine, e.g. for peaches or apples, has an endless conveyor rotating around two ring gears on vertical axes, the conveyor supporting a row of half cups for fruit. An idler roller is mounted on each half cup opposite the hinge attaching the cup to the conveyor and runs on a horizontal rail parallel to the conveyor.

The machine also has a fruit processing station, and a discharge station where the rail has a downward portion to allow the cups to pivot to discharge the fruit. Fruit falling into a cup is processed by tools carried by mandrels slidable on cylindrical crowns. The appts. operates continuously and is simple in construction. 24.5.77 as 799979 (+10.1.77 - IT - 046801) (15pp1379).

THER- ★ D14 36986B/19 ★US 4151-094
Moving belt filter employing rotating brush - to remove solids from belt and project them onto catchment plate
THERMO KINETICS 15.08.77-US-837305 (29.12.72-US-319748)
J01 (24.04.79) B01d-33/14

Filtration appts. of the type including a moving filter belt has a rotating brush having radially-extending bristles which remove the deposited solids therefrom whilst the belt is supported on a backing roll. The removed solids are projected as a stream onto a splash plate from which the solids descend to a collection zone. The position of the brush w.r.t. the belt is adjustable e.g. by pivoted mounting. The tension of the belt is adjusted by mounting the support roll, the brush and splash plate on a movable support e.g. pivoted at and moved by fluid operated cylinders.

The solid removal system avoids smearing of the solid particles into the filter belt. Used esp. in the reclaimation of protein for pet food mfr., 15.8.77 as 837305 (+30.6.75 - US - 591756) (5pp1050).

Treating waste water by biological oxidn. and carbon adsorption - with recycling of biomass and carbon after oxidn. treatment
STERLING DRUG INC 10.11.77-US-850262
(07.05.79) C02c

The process comprises contacting the water with a mass of diversified acclimatised aerobic microorganisms and powdered active carbon in the presence of dissolved oxygen maintained at above 1ppm. to substantially reduce the COD and BOD by absorption and biological oxidn. The carbon/biomass is sepd. and a part is recycled to the first stage The remainder is submitted to a partial oxidn. by humid means at 200-160°C for 30-60 mins. limiting the inlet of oxygen contg. gas such that the exit gas contains < 7 vol. % of oxygen. The suspension is recycled to the first tstage with addn. to fresh carbon to make up loss in processing. The whole cycle is then repeated resulting in an effluent with a substantially reduced COD, BOD, and ammoniacal nitrogen content.

The process enables fast nitrification compared to processes in which regenerated active carbon is used. 7.11.78 as 871813 (12pp597)

Semipermeable membrane fluid separator of hollow fibres - incorporates flattened bundles of fibres in ribbon form arranged as crossing multiple layers maximising efficiency
TOYO BOSEKI KK 10.01.78-JA-001775
J01 (02.05.79) B01d

An appts. for sepg. fluids by means of a semipermeable membrane comprises layers of hollow fibres having a selective permeability placed around a central element. The layers are formed by bundles of hollow fibres placed parallel to one another and flattened to form ribbons. The bundles are arranged as multiple layers crossing one another at points between the ends of the appts.

Membrane sepn. is applied in gas filtration, liq. filtration dialysis, ultrafiltration, reverse osmosis, in processes such as conversion of sea water to fresh water, puricn. of waste waters, concn. of fruit juices, sepn. of oil from water, the artificial kidney and the artificial lung. The arrangement leads to uniform distribution with a high density over all the layers without the formation of free spaces, efficient use of the membrane surfaces giving incr-eased efficiency. 9.1.79 as 873354 (18pp1192)

Breaking oil-water or fat-water emulsions - by stirring with a fibrous material and allowing to separate into aq. and organic layers
LAUERMANN G 01.12.77-DL-202330
A97 J01 (D23) (14.02.79) B01d-17/04 C07c-31/22

Process is claimed for breaking glyceridic fat-water and /or glyceridic oil-water- and/or fat deriv. -water emulsions. Up to 1, (pref. ⩽ 0.5)% of a fibrous material is added to the emulsion or to the material to be treated with water, and the mixt. is stirred for ≥ 30 mins at ≥ 60 °C (esp. 80-95) °C to break the emulsion. The aq. lower layer is then sepd. from the upper organic layer contg. the fibrous material, and the fibrous material is removed by any suitable means, e.g. by passing the organic layer through a sieve.

Process allows stable oil and fat emulsions to be broken efficiently without addn. of electrolytes or materials which would contaminate the aq. or organic layers. 1.12.77 as 202330(10pp513)

DEAK ★ D15 35426B/19 ★DL-134-447
Asymmetrical polyacrylonitrile membrane - produced by pptn. from soln. contg. additional polymer, for water treatment etc.
AKAD WISSENSCHAFT DDR 24.10.77-DL-201662
A88 J01 (A14) (28.02.79) C08j-05/22

Acrylonitrile polymer membranes with increased water permeability are prepd. by addn. of 1 or more polymers to the soln. of polyacrylonitrile in the usual solvents, pref. DMF before the soln. is shaped. The additives are sol. in the polyacrylonitrile solvent and insol. in the pptn. agents for the polyacrylonitrile. The components of the polymer mixt. are incompatible, i.e. the viscosity of the soln. of the mixt. is lower than would be calculated according to the additivity rule. The soln. is cast to a film and solidified by pptn. of the polymer mixt.

The selectivity of the membrane is not affected. The asymmetric membranes are used for sepn. of dissolved or emulsified substances from water. 24.10.77 as 201662(10pp510)

DEAK ★ D15 35427B/19 ★DL-134-448
Asymmetrical polyacrylonitrile membrane prepn. - by two/stage pptn. in baths of differing pptn. rate, used for water treatment
AKAD WISSENSCHAFT DDR 27.10.77-DL-201656
A88 J01 (A14) (28.02.79) C08j-05/22

Membranes are prepd. from solns. of acrylonitrile polymers in DMF by pptn. of the polymer from the shaped soln. in two consecutive pptn. baths. The first bath has a lower precipitating power than the second bath. The polymer pref. contains ⩾70 wt. % acrylonitrile.

The selectivity of the membrane is improved, without affecting the water permeability. The asymmetric membranes are used for sepn. of dissolved or emulsified substances from water. The membrane may have the form of a hollow fibre. 27.10.77 as 201656(12pp510)

IONI D15 19285R/12 #DS 2014-498
Determination of carbon in polluted aqueous solutions
IONICS INC (UNIC) 02.10.68-US-466664 (25.03.70-DT-014498)
*J04 R16 (03.05.79) *GB1185-290 +G01n-31/10 G01n-33/18*

The carbon content of aq. solns. is determined. The sample in a carrier gas free from oxygen, e.g. N_2, He or Ar, is passed to a reaction chamber where the carbon present is oxidised with a catalyst to CO_2. The oxygen needed is obtd. from the water in the sample by means of a catalytically active element, pref. a coil of Pd wire. The prods. leaving the reaction chamber are collected as a liq. condensate and a gaseous fraction and both prod. fractions are analysed for their CO_2 content.

The process is conducted at a lower temp. than when a gas contg. oxygen is used and with a lower risk of explosion. 25.3.70 as 014498. (7pp068)

MGEI D15
Sewage sand trap - with tangential inlet central solids removal and separate solids grading
MASCH H GEIGER (GEI -) 14.07.70-DT-034796
*(03.05.79) *DT2034-796 B01d-21/06 +C02c-01/20*

Device to separate granular solids from liq., e.g. a sand trap, consists of a circular tank with a flat bottom and revolving raker arms which scrape the sand to the centre. The crude water enters tangentially and leaves, free from sand, radially after a turn of > 270°. The standis raised by an injector pump from the central pit to a classifier, parallel to the inlet channel. Clear water returns through an overflow sill into the inlet channel.

Appts. does not require deep excavations and creates favourable flow conditions. 14.7.70 as 034796. (4pp39)

DIDI D15 46273X/25 =DS 2457-51
Industrial wastes treatment - convertible from continuous to bath operation by tilting mixer with air jets for efficiency neutralizing agent
DIDIER-WERKE AG 05.12.74-DT-457514
*(03.05.79) *DT2457-514 C02c-05*

Appts. for the treatment of industrial wastes which have been contaminated by chemicals, e.g. from electroplating hardening and pickling establishments, includes a mixing tube with an inlet funnel at one end for the wastes and the neutralisation agent. Compressed air mixing jets along the tube provide the propulsion. At the outlet end, the effluent must pass a probe which controls the admission of the neutralisation agent before the liq. is discharged through an overflow.

When used to treat batches of higher concn., the inlet end of the mixing tube can be lowered and the discharge end delivers the outflow to a launder. 5.12.74 as 457514 (4pp39)

cavenger for floating matter in sewage settling tank - rides up
amp and is held high whilst returning

WIBAU GMBH 11.09.78-DT-839410

(03.05.79) C02c-01/36

t the one end wall of a rectangular settling tank on a
ewage farm, a ramp is inclined upwards to the overflow
nto a drain channel for floating matter, and the scavenger
lade drawn by the mobile bridge across the tank, rides
p the ramp to the overflow and is locked in position above
ne water level. On returning to starting point the blade
s lowered again into the water and the skimming process
s repeated.

The scavenger blade is designed to float in the water,
nd is automatically locked when it reaches the height of
ne drain channel wall, by a latch on the bridge. At the
tarting point the latch is pushed away into the unlocked
osition and a braking arrangement between the bridge
nd the blade supporting mechanism slows down the lower-
ng into the water.

System dispenses with unnecessary additional lifting
echanisms for the scavenger blade. 11.9.78 as 839410.
pp1045)

PP ★ D15 35460B/19 ★DT 2747-215

esalination plant for distilled water and salts recovery - reduces
nsiderably the ratio of energy required to water produced

KRUPP F GMBH 21.10.77-DT-747215

01/38 C09k-03/32 E03f-05/16*

particles are scpd. out of effluents by a filter arrang-
ent comprising a housing with inlet and outlet between
ich a self-supporting body forms the filter element. The
er element consists of small pieces of a soft, foamed,
nthetic material, with open cells. The cell walls are
oken down by subjecting the material to a mechanical,
n-disintegration pressing action. The small pieces of
m are afterwards bonded together by a adhesive under
ssure.

Fully effective means of sepg. oil from effluents is pr-
ded much more efficiently than by scattering absorbent
terial on the surface of the water on floors, etc. which
any case is impractical with, e.g. the swilling water
m ships oil tanks. The filter(s) bind the oil particles
ch expel the water from the filter material so that the
er becomes practically satd. with oil without allowing
to pass through. 22.10.77 as 747469 (16pp1045)

Water clarification system for intensive fish farming - centrifuges effluent to which oxygen and hydrated lime are added

TEBBENHOFF E 27.10.77-DT-748084

P14 (03.05.79) A01k-63

Stale water continuously drawn off from a pond on a farm for intensive fish prodn., and replaced by clarified, esp. aerated water, is centrifuged to separate it into a concentrated sludge and clarified water. This with the addn. of a quantity of fresh water is then returned to the pond.

System maintains the water in fish ponds for intensive prodn. in a condition in which the fish thrive and are free from disease, without a clarifying process which is disproportionately high in cost and requiring the input of energy to maintain the temp. of the pond uniform in summer and winter.

Solid matter is removed at a rate which is higher than that at which bacteria and fungus can multiply. The sludge produced can be composted and used as fertiliser. The concentration of salts and dissolved organic matter can also be maintained at a level to keep the fish healthy.

Oxygen in the form of fine bubbles in injected into the stale water as it is drawn from the tank, and before centrifuging also, hydrated lime is added. This precipitates calcium carbonate which envelopes particles of albumen etc. The ratio of clarified to fresh water returned to the tank is only as 8:1. 27.10.77 as 748084 (11pp1045)

Nozzle device for jetting mixt. of gas and liquid into liqui
comprises a shroud having orifice which admits restricted flow
liquid into the shroud

PORTALS WATER TREAT 09.09.76-GB-037459
*P41 (10.05.79) *ZA7705-259 +B01f-03/04*

A liq. clarification appts. comprises a nozzle for intro
ducing a jet of liq. supersaturated with a gas into a raw
liq. through a shroud. The supersaturated liq. passes
rough an orifice provided within the shroud and a restr
ed flow of raw liq. is admitted into the shroud through
vent downstream of the orifice(s) so as to form a film
raw liq. over the inside surface of the shroud downstre
of the vent.

The liq. may be water and the gas may be air, the s
being led to a manifold carrying orifices and submerge
in the solid/liq. suspension to be treated e.g. a floccul
ed aluminium hydroxide. 26.8.77 (4pp1363).

Removing oil fat, wax, etc. from a surface - by forming
emulsion using a polyether phosphate surfactant, and bre
emulsion to recover oil wax, etc.

BEROL KEMI AB 28.10.77-SW-012179
E11 (10.05.79) C02b-09/02

A water-insoluble cpd. (I) is removed from a surface
recovered by forming an emulsion of the cpd. in wate
ing a surface active cpd. The emulsion is broken into
organic and an aq. phase and the phases sepd. The su
factant is of formula $R-(A)_n-O-P(=O)(-OH)-OR'$ (II) (w
R is 8-30C hydrocarbyl; each A is a gp. derived from
2-3C alkylene oxide; n is 1-30; R' is H or $R-(A)_n-$).
emulsion is broken by adjusting the pH to 7-10.

Used for removing oil, fat, wax, etc. from surfac
A stable emulsion is readily obtd. and the oil, etc. r

ily recovered. 25.10.78 as 841936 (3pp904).

TOKU ★ D15 35927B/19 ★J5 4041-194

Gas chromatographic determn. of organic substances in water - using a packed column having a condensed water contg. zone

TOKUYAMA SODA KK 08.09.77-JA-107199

J04 R16 (02.04.79) G01n-31/08

The condensed-water-contg. zone in the packed column is formed by, e.g., injecting a certain quantity of pure water into the column maintained at >100°C., followed by cooling the column to a desired temp. <100°C. When a sample is injected into the column, water content in the carrier gas flow is maintained at the satn. level by the water-contg. zone, and only non-aq. substances can effect changes in signals from a detector.

Method is used for continuous monitoring of organic substances in plant waste water, recycled industrial water etc. Effect of water on the base-line of the chromatogram is excluded, and, consequently, a number of samples can be analysed in succession. 8.9.77 as 107199 (7pp173)

MIHA/ ★ D15 35968B/19 ★J5 4041-269

Nitrogen removal from waste water - by intermittent aeration in controlled conditions

MIHASHI K 07.09.77-JA-107373

(02.04.79) C01b-21 C02b-01/23

Process for effectively removing nitrogen in a waste water is claimed, in which organic components in the waste water are decomposed by controlled nitrification and denitrification reactions in the treatment bath by repeating intermittent aeration and intermittent non-aeration alternatively, and adjusting the time and the amount of intermittent aeration against intermittent non-aeration (which is indicated by the ratio of (N as NH_3)/(N as HNO_3) in the water under the treatment).

By adjusting the time and the amt. of intermittent aeration against intermittent non-aeration, both aerobic and anaerobic decomposition of organic substances, nitrification and denitration of inorganic nitrogen compounds can be carried out effectively and sufficiently. The equipments and process are relatively simple, and the amts. of reactants such as acid, alkali, and methanol are reduced. Also reduced is the amt. of activated sludge to be produced. 7.9.77 as 107373 (2pp55)

SUMH ★ D15 35969B/19 ★J5 4041-270

Treating waste water contg. heavy metal ions - includes adding ferrous salt, then caustic soda, and blowing oxidising gas into soln.

SUMITOMO SHIPBUILD KK 07.09.77-JA-107566

(02.04.79) C02c-05/04

A ferrous salt (e.g., ferrous sulphate) is added to waste water contg. (2+) heavy metal ions, caustic soda is added to make it alkaline (pH 10-12), air or oxidising gas is blown into the soln. to carry out a ferrite-prodn. reaction. The same procedure is repeated. An acid (e.g., HCl or H_2SO_4) is added to the soln. to adjust its pH to ca. 1, and the same procedure repeated. A slurry-type prod. is sepd. and removed. The remainder is diluted with water and the same procedure is repeated in order to carry out a second ferrite-prodn. reaction. The ferrite-prodn. reaction is carried out at least twice.

Process is useful for treating waste soln. contg. esp. AZn(++), Cd(++), Mn(++), Cr(++), Fe(++), Sn(++), As(++), Ni(++), Hg(++), Pb(++), and Cu(++). 7.9.77 as 107566 (4pp55)

Treating domestic waste water - by passing through electrically activated carbon filler layer, to remove particles by hydrogen flotation, and filtering through sand

HITACHI KK 09.09.77-JA-107726

(02.04.79) C02c-05/12

The waste water is passed through a filler-layer (which is spherical or granular active carbon filled between a pair of anode and cathode), and suspending particles in the water are floated by hydrogen bubbles emitted at the cathode side of each active carbon particle, by applying high electric voltage. The treated water is filtered through a sand layer, to be purified further. 9.9.77 as 107726 (4pp55)

NIKN ★ D15 36049B/19 ★J5 4041-550

Steel plant waste treatment - comprises mixing converter and blast furnace effluents to effect neutralisation and pptn. of zinc components

NIPPON KOKAN KK 07.09.77-JA-106793

M24 (02.04.79) C02c-05/02

A blast furnace dust-collecting effluent and a converter dust-collecting effluent produced in an integrated steel plant which have been hitherto treated separately, are effectively treated simultaneously without using any chemicals, e.g. NaOH and H_2SO_4 etc. and without encountering any problems in installation and anti-pollution respects.

Method comprises blending together the blast furnace dust-collecting effluent and the converter dust-collecting effluent in portions or in all amt. prior to the outflow into rivers to increase the pH value of the acidic blast furnace dust-collecting effluent and simultaneously to lower the pH value of the converter dust-collecting effluent, Zn components dissolved in the formed effluent is settled-out as flocs in the neutralisation reaction. The mixing ratio between the former and latter effluents is determined in accordance with the pH values or the amt. of the dissolved metal component. 7.9.77 as 106793 (8pp142)

DOWA ★ D15 36050B/19 ★J5 4041-551

Treating waste liquor having high metal salts concn. - by neutralisation, with residence time controlled to increase crystal size of sludge prod.

DOWA MINING CO LTD 07.09.77-JA-107592

(02.04.79) C02c-05/02

A waste liquor having high metal salts concn., e.g., contg. a Zn salt capable of forming a Zn ppte. or reacting with alkali, e.g. $ZnCl_2$, $ZnSO_4$ and $Sn(NO_3)_2$ etc. is neutralised and concd. without any dilution by introducing simultaneously the waste liquor to be treated and a neutralising agent, e.g. NaOH, Na_2CO_3 and $Ca(OH)_2$ etc. into a reaction vessel equipped with an overflow outlet. The neutralisation reaction is carried-out at temps. >50°C. and under a neutral pH range, and continuous overflowing of the ppte.-contg. liquor to the outside takes place. The retention time in the reaction vessel is pref. about 30 mins., and the unreacted Zn salt soln. is overflowed when the retention time is <30 mins., and the granular size of the ppte. is decreased when the retention time becomes longer than 30 mins. in the case that the process is applied to a soln. having comparatively lower Zn concn., i.e. <500 ppm. But the retention time is such extent that the unreacted Zn soln. is not overflowed when the Zn concn. exceeds 5 g./l. The resulting sludge contains a ppte. having large crystal size and is very easy to filtrate, and it is used as a metal material due to its very high metal content. 7.9.77 as 107592 (4pp34)

EBAI ★ D15 36051B/19 ★J5 4041-552

Sewage sludge concn. - by mixing mineral petroleum oil with sludge and subjecting mixt. to flotation concentration

EBARA INFILCO KK 08.09.77-JA-108175

(02.04.79) C02c-03

Sewage sludge, e.g. mixed raw sludge and surplus activated sludge etc. obtd. in sewage treatment, is conc. rapidly and in very high concn. by adding to it mineral petroleum oil, e.g. with initial b.pt. >150°C. and contg. no volatile components, in an amt. of 10-300 (pref. 30-100) wt.% based on solids in the sludge, and subjecting it to a flotation concn. treatment with a residence time of $\geqslant 1$ hr.

Specifically, a treated water is introduced into a compressed tank while compressing at 3-6 kgf./cm.^{2}-G, after which air is dissolved in it by using a compressor, to give an air-dissolving compressed water which is then introduced into a flotation separator via an ejector while mixing, by suction, with the sewage sludge mixed previously with the mineral oil. Fine air bubbles generated by the reducing pressure stick to the oil-adsorbed solids which then rise to the surface of the water and float. After >1 hr. they are discharged to the outside. 8.9.77 as 108175 (4pp34)

MITR ★ D15 36052B/19 ★J5 4041-553
Oil-absorbing waste water treating material - comprises polymer fibrous prod. coated with acidic phosphoric acid ester and laminated on polymer based composite powder
MITSUBISHI RAYON KK 08.09.77-JA-108223
A97 (A17 A23) (02.04.79) B01d-15 C02c-05/02

A waste water treating material is claimed which exhibits excellent oil absorbability w.r.t. emulsified oil-contg. waste water not only stabilised with cstionic or nonionic surfactant but also stabilised with nonionic surfactant as well as exhibiting excellent water wettability, and large effective contact area with water without any flotation. Material is suitable for use in treatment of cutting oil waste water, rolling oil waste water, machine-washed waste water, paint factory effluent, foodstuff waste water, dyeing waste water, pulp mill effluent and paper industry effluent etc.

Treating material is proxuced by laminating a polymeric fibrous material, e.g. made of polyethylene-terephthalate etc., the surface of which is coated with alkyd or alkylaryl acidic phosphoric ester or its alkali metal salt, on a fine composite material having surface area of >0.01 m.^{2}/g., composed mainly of a polymer, e.g. polyethylene and polypropylene, etc. and oxide (or hydroxide) of Si, Ca or Mg. 8.9.77 as 108223 (6pp34)

HITA ★ D15 36053B/19 ★J5 4041-556
Treating organic effluent contg. large amt. of nitrogen components - in which activated sludge flotation due to nitrogen formation by action of denitrification bacteria is prevented
HITACHI KK 09.09.77-JA-107728
(02.04.79) C02c-01/06

Organic effluent contg. a large amt. of nitrogen components is treated by introducing it into an aeration vessel where the effluent is aerated with O_2 in the presence of activated sludge, and subsequently introducing the aerated effluent into a settling vessel to separate it into activated sludge and treated water.

The improvement comprises introducing the aerated effluent discharged from the aeration vessel into a denitrification vessel maintained under anaerobic conditions, where the aerated effluent is blended with a portion of the organic effluent which has been not subjected to the activated sludge treatment (as hydrogen donor) and NO_3^- resulting in the aeration vessel is reduced to N_2 by the action of denitrification bacteria.

The blended liquor thus treated is then introduced into a vessel where it is aerated to remove N_2 by desorption from the activated sludge and to completely oxidise the remaining portion of unoxidised materials contained in the effluent. The liquor is finally introduced into the settling vessel, so that the activated sludge is completely sepd. from the treated water without any flotation of the sludge due to the formation of N_2 by the action of the denitrification bacteria. 9.9.77 as 107728 (3pp34)

KUBI ★ D15 36208B/19 ★J5 4042-362
Dehydration of sludge - by adding hydrochloric acid and ferric chloride to form flocks, then dehydrating
KUBOTA KK 10.09.77-JA-109274
(04.04.79) B01j-01 C02c-03

The method used in treatment of excrements, sewage, organic industrial waste water, etc. comprises adding HCl and $FeCl_3$ to sludge to form sludge flocks, and then dehydrating it.

As flocks of sludge of a given size and strength can be stably obtd., excellent dehydration efficiency can be achieved, forming a cake of a stable water content.

The amt. of HCl added as coagulating agent is 3.0-13.0%, and that of $FeCl_3$ 7.0%. In an example, 6.5% of HCl (35% concn.) is added to a sludge of solid content 3.8% (pH 7.5) and stirred for 10 min., 7.0% of $FeCl_3$ is then added and stirred for 5 min., and resulting flocks are then filtered. The water content of resulting cake is 83.3%, and filtration velocity is 22.6 Kg.ds./m.^{2}-hr. (cf. when 20% of $Ca(OH)_2$ and 7.0% $FeCl_3$ are added where filtration velocity is 11.9 Kg.-ds./m.^{2}-Hr.). 10.9.77 as 109274 (3pp50)

M14 (05.04.79) C02c-05/08 C23g-01/36 C25d-21/20

The metal is washed in a primary washing water and in a secondary washing water after being pickled or plated. The primary washing water is regenerated by an electrodialysis tank. The secondary washing water is regenerated by an electrolysis tank and an anion-exchange resin appts.

Washing water having a good quality and being close to neutrality is obtd. without draining to the outside. Operation is relatively stable and easy. Since metal ions are concentrated by electrodialysis while the waste water is regenerated, valuable metals can be recovered easily and efficiently. 13.9.77 as 110207 (3pp7)

Making industrial waste harmless - by slurrying with aluminosilicate, water etc., and an alpha-diol type poly:hydric alcohol which is subsequently polymerised
OGASAWARA T 12.09.77-JA-108787
A97 E34 L02 P35 (05.04.79) A62d-03 B01j-01 C04b-13

Harmful industrial wastes are made into a slurried suspension by the addition of aluminium silicate or aluminosilicate, Portland cement, and water, and then the slurried suspension is hardened by causing the polymerisation of an alpha-diol type polyhydric alcohol, as curable reactant, and an alkali metal salt of silicic acid and boric acid or borax, as polymerisation regulators, to take place within the slurried suspension. The alpha-diol type polyhydric alcohol used includes glycerol, mannitol, erythritol, etc.

The method is capable of easily controlling the time of polymerisation, the density of matrix of solidified wastes, and strength of the solidified wastes, giving pebble-like hardened solid in which harmful substances are securely confined in such a way that they are not dissolved out even when dipped in water for long period. 12.9.77 as 108787 (4pp117)

Appts. for exchange of material between two fluids comprises a housing enclosing a bundle of hollow fibres with permeable walls and means for passing the first fluid through the housing over the outer surface of the fibres whilst the other fluid through the internal passages in the fibres.

Improvement is that the housing has a number of wall sections next to the bundle of fibres which are so shaped that they form enlargements in the cross-sectional of the housing and cause the first fluid to flow transversely across the bundle of fibres. The appts. is used in artificial kidney and lung machines, for desalination of water, thickening of fruit juices, removal of sediment from beer etc. By forcing the first fluid to flow transversely across the fibres, good mass transfer is achieved by the high velocities and boundary layer distrubance in the centre as well as the outer parts of the bundle. 1.2.75 as 013563 B01d-13/00, 31/00, A61m-1/03 (17.4.79) NIPPON ZEON (17pp) (J51101790)

Floating solar still with submerged condenser - giving up heat of condensation to incoming cold water, used to produce potable water from sea or brackish water
EIDELBERG J 27.03.78-US-890785
(24.04.79) C02b-01/06

A floating solar still comprises a floating frame having its top covered by transparent glass, its bottom covered with wooden boards and its sides having water inlets close to the bottom. The water is preheated prior to evapn. by a submerged condenser which is located within the frame between the bottom and a corrugated heat absorbing metal plate.

The corrugated metal plate is positioned so that one part of it is immersed in the distill and while the other part consisting of the ridges of the corrugations, remains above the surface of the distill and leaving free spaces beneath the ridges which are used as ducts. Evaporated vapour flows from these ducts down conduits to the submerged condenser.

The thermal efficiency of the still is improved by using the heat of condensation for preheating the distilland before evaporating it. 27.5.78 as 890785 (3pp295).

Continuous separation of two liquids of differing density - by passing between imperforate plates inclined to horizontal
OTHMER D F 11.06.76-US-694954
(24.04.79) C02c-01/06

A mixt. of two fluids of different density is sepd. by passing between an array of parallel imperforate plates with a spacing of ⩾0.5 inch between each pair of plates. The plates are inclined to the vertical along their major axis at an angle of 15-75° and at an angle of 1-20° along their minor axis.

The fluid mixt. is introduced at the lower end of the major axis and passes upwards between the plates where the two phases become sepd. so that the heavy phase returns to the bottom of the array and the light phase rises The inclination of the minor axis causes the heavy phase to be directed towards one edge of the plates.

The appts. may be used to settle a dense phase from a water-based sludge. The inclination of the plates to the horizontal along their minor axis separates laterally the falling heavy phase and rising light phase so as to prevent interference while moving in opposite directions along the major axis of the plates. The minor axis inclination concentrates the falling heavy phase into a stream which can be collected in a manifold at the lower end of the plates without undue mixing with the feed mixt. 11.6.76 as 694954 (18pp295).

Dewatering slurry e.g. sewage by pumping into press - an operating press while monitoring parameters to calculate cak solids concentration

ENVIRO DEV CO 13.02.78-US-877168

(24.04.79) B01d-25/12 C02b-01/18 C02b-03/06 C02c-01/40

A solids-laden water slurry is dewatered by pumping into a filter press to produce a solid cake, while effluent wate is recovered. Prior to filtration the solids concn. of the feed is measured and during filtration the vol. of expressed water is recorded. From these measurement the solids concn. of the filter cake is computed.

A resource factor signal is determined by the rate of change of the solids concn. and is opt. used to terminate the pressing operation when a preset value is reached. Typically the computed solids concn. of the filter cake i used to adjust the characteristics of an incinerator for the cakes.

The appts. removes solids from municipal sewage and prepares a cake which is subsequently incinerated. The appts. adjusts to different concns. of solid in the sewage feed. The resource factor signal terminates the pressing to maximise the throughput of the appts. even through the filter cake may not have been maximally concn. 13.2.78 as 877168 (9pp295).

Semi permeable, cellulose microcapsules contg. powdered adsorbent - in cellulose gel matrix, useful selective adsorbing agents
TOYO BREWING KK 20.02.75-JA-020381
*A97 B04 J04 (17.04.79) *NL7503-577 B01d-15 B01j-13/02*

Cellulose microcapsules with adsorbing properties and an external dia. of 100-5000 μ comprise a semi-permeable outer layer of cellulose 0.5-5 μ thick with micropores of dia. 10-80A, and an inner layer comprising a powdered adsorbing agent dispersed in a cellulose gel matrix.

The prods. have good chemical resistance and are useful e.g. for removing and purifying antibiotics from culture broths, extn. and purific. of nucleic acids from microorganism cells, extraction of natural dyes, recovery of useful materials from effluents, decolourisation, etc. 20. 2. 75 as 020381 B01j-13/02, B01d-15/00 (17. 4. 79) TOYO BREWING KK (8pp) (J51095989)

Cultivating mushrooms - using a water permeable resin fibre tube
MITSUI PETROCHEM IND KK 05.03.75-JA-026087
*A97 F09 P13 (17.04.79) *J51102-981 A01g-01/04*

A compsn. consisting of thermoplastic resin fibre and a lightweight filler is moulded into a paper on which resin fibre is adhered by melting, and then moulded into a tube which has water-permeable side walls. In the tube, myce-lia are cultivated so that the mushrooms are allowed to develop on the side wall of the tube. The resinous fibres have 0. 5-50mm ave. length, 5-100 μ dia. and are used in a concn. of 50-90 wt. %. The lightweight fillers are shirasuballon, expandable perlite, etc. The water-permeable coefft. (JISA 1218) of the side wall of the tube is pref. 5×10^{-5}-1×10^{-2} cm/sec.

There is no problem with deficiency or the rising cost of base wood and unstability of the yield which depends on the quality of the base wood, etc. Seasonal factors become small. 5. 3. 75 as 026087 A01g-1/04 (17. 4. 79) MITSUI PETROCHEM KK (3pp)(J51102981)

New antibiotic 5057, esp. effective against Gram positive bacteria - is obtd. by culturing a microorganism of the genus Streptomyces

KAKEN KAGAKU KK 09.03.76-JA-024636

*B04 C03 (17.04.79) *J52108-902 C12d-09/14 +A61k-35/74 C07g-11*

The new antibiotic 5057 is obtd. by culturing a microorganism belonging to the genus of Streptomyces which is capable of producing the antibiotic 5057, and recovering the objective cpd. (I) from the culture. Cultivation is carried out in a conventional method. Liq. cultivation method, partic. submerged cultivation is suitable. Cultivation is conducted under aerobic conditions at 25-35°C, pref. 30°C.

The accumulation of (I) generally reaches a max. after 3-7 days in the case of shaking cultivation or tank cultivation. Since (I) is fat-soluble and acidic, it can be recovered by extn. by various solvents and/or chromatography by various active adsorbents. The present 5057 substance producing microorganism is deposited as FERM-P No. 464.

(I) has strong antibacterial activity partic. to Gram-positive bacteria. Further, it shows strong growth inhibiting activity to broad spectrum of bacterial such as acid-fast bacteria and funji. 9. 3. 76 as 024636 A61k-35/74, C07g-11/00, C12d-9/14, (17. 4. 79) KAKEN KAGAKU KK (9pp) (J52108902)

Bacterial sensitivity testing to antibiotics and chemotherapeutics by - light intensity measurements

SCIE SPECTRUM INC (SCI -) 04.05.70-US-034243

*B04 +R16 (18.04.79) *DT2121-994 C12k-01 G01n-21/22*

The bacteria to be screened are placed in a small, sharply defined beam of light and the intensity of the scattered light is measured in dependence of the angle of scattering. The measurement are repeated in consecutive periods of time, to record changes in the scattered-light intensity which occur when the bacteria are sensitive to an added antibiotic.

The test allows sensitivity-screening of bacteria to one or more antibiotics and/or chemotherapeutic agents in a very short time. Tests can be carried out on suspensions with a high concentration of bacteria or on a representive number of single cells. 4. 5. 71 as 028991 (clg. 4. 5. 70-US-034243) C12k-1/00, G01n-21/22(18. 4. 79) SCIENCE SPECTRUM INC (4pp) (J46006848)

(5)-Amino-(4)-imidazole-carboxamide and D:ribose prodn. - usi microorganism of e.g. genus Achromobacter and (5)-amino-(imidazole-carboxamide-riboside

AJINOMOTO KK 22.07.75-JA-089512

*B03 (18.04.79) *J52012-985 C12d-13*

5-amino-4-imidazolecarboxamide (AICA) and D- ribose are produced by decomposing 5-amino-4-imidazolecarbo amide-riboside (AICAR) with an enzyme of microorganis AICA and D-ribose are physiologically very important substances and are useful as medicaments or raw materials for the prodn. of medicaments. Microorganisms producing the enzymes used in the present invention are e.g. Achromobacter dermarvae AJ-1983 FERM-P 21 Aeromonas formicans AJ-2532 ATCC 13136, Aeromonas hydrophila AJ-2623 IAM 1018, Alkaligenes metalcaligen AJ-2554 ATCC 13270, Arthrobacter aurescens AJ-1430 ATCC 13344, Brevibacterium pussilum AJ-1462 FERM P 3148, Corynebacterium glutamicus AJ 1502 ATCC 130 Enterobacter aerogenes AJ-2653 ATCC 13048, and the like.

Cultivation is conducted at pH of 6-9, at 20-40°C for 1-3 days under aerobic conditions. The enzyme is used in the form of culture liq. cells of microorganism, free dried cells, acetone-dry cells, extract of the cells in th purified form. The concn. of AICAR in the reaction liq. is 0.1-30 (0.5-20% in the aq. medium. The reaction is conducted at 10-80 (30-60)°C, at pH of 5-9 (7). After th reaction is over, the reaction liq. is removed of solid materials such as cells and treated with active carbon.

The liq. is then passed through a strongly cationic e change resin column such as Dowex 50 H^+, Amberlite I 50 H^+, and the eluate is concentrated to give a syrup or powder of D-ribose. The resin column is washed with water and the absorbed AICA is eluted with HCl. The el uate is then treated with active C and then concd. to giv AICA-HCl. 22. 7. 75 as 089512 C12d-13/00 (18. 4. 79) AJINOMOTO KK (4pp) (J52012985)

Entomopathogenic Entomophthora lairdii fungal strain - used in biological control of blood-sucking gnats and mosquitoes in larval or imago stages
AS KAZA ZOOLOG INST 23.02.76-SU-327697
C03 (11.09.78) A01n-15 C12k-01

Entomopathogenic fungal strain Entomophthora lairdii is useful in biological control of blood-sucking insects producing annoyance or acting as disease carriers, without danger to man.

This fungal strain is pathogenic to blood-sucking gnats and mosquitos. It grows in blood cavity of gnats larvae or mosquito imago depleting food-store of the insects, lowering their vital functions and finally killing the insects.

The strain E. lairdii can be stored in a form of dried spores for over two years. It produces death of 60-80% of larvae and imagos of above insects (e.g. Aedes aegyti, Ae. flavescens, Ae. caspins, Culex pipiens molestus, Cx. pipieus).

The sepn. of cellulose (I) by pptn. from its soln. e.g. a culture medium involves pptn. of the ferment on a sorbent, filtration of the resultant sorbate and drying of the latter in the usual way, e.g. hot air. A fermental soln. is cooled to 5-15°C prior to the addn. of the sorbent. The latter is a finely ground cellulose, particle size 10-100 microns. The soln. prior to addn. of the sorbent, should pref. be cooled to 5-15°C and the ground cellulose be added in the amt. of 0.1-10g. per each 50 activity units of the ferment.

The method increases the yield of the ferment to 95-100% eliminates use of the organic solvents and neutral salts for its pptn., enhances purity and storage stability (activity of the ferment remains unchanged after 1 year storage at 20°C), reduces its costs, utilises waste prods. from the cellulose-paper industry as the sorbent.

BIOTECH RES 18.10.76-SU-413245
P13 (29.06.78) A01g-31/02 C12b-01/10

Reduced weight and volume of the microorganisms culture unit is provided by the heat exchanger which featur a chamber with connectors for the coolant. The chamb surrounds the housing of the gas exchange unit, and hol the helical tube of the condenser whose one end is conne ted to the gas exchange for feeding the air-gas mixture. The other end of the tube is connected to the condensate collector. The combination of the parts reduces the connecting lines, and thus decreases the hydraulic resistance of flows.

The liquid flow inducer suction connected to the condensate collector ensures return of the condensate into the circulation, and thus reduces energy consumption.

Baker's yeast prodn. by fermentation of sugar prod. waste - inclu multistage biomass washing using in second step aq. alkali s and then water again
KIEV FOOD IND TECH 07.10.76-SU-410583
(D11) (15.06.78) C12c-11/24

Bakery yeasts, grown e.g. on molasses, are washed stepwise with water at a predetermined pH. This proce is improved by using in the second washing step an aq. alkali soln. having pH 11-13 for 5-15 min.

By this method, colouring substance are removed rapidly from the yeast cell surface; the water consump is reduced by 30-40%; the separation degree is lowere from 5 to 4; and the consumption of the electric energ is decreased. After the alkali washing step, the yeast are washed with artesian water.

Evaluating enzyme amylolytic activity during microbiolo prodn. - by introducing iodine into nutritive medium and meas increase of light transmittance with time
BIOTECHN RES INST 12.07.76-SU-382291
(15.06.78) C12d-13/10 C12k-01

The amylolytic properties of various enzymes can be determined by cultivating the enzyme-producing micr organisms in a heated nutritive medium and measurin their amylolytic activity with an electrophotocalorime in comparison with control samples.

The method is simplified by introducing into the m dium, before the heating, an iodine soln. and measuri the light-transmittance increase (to 30-40%) resulting from the amylolytic activity of the enzyme (as a time ction, using a calibrated chart).

A sulphonated, aromatic reaction prod. for tanning hides and leather is obtd. from (1) 100 pts. wt. of a sulphonation prod. (I) and (2) 4-24 pts. wt. of a reaction mixt. of (d) an aminoplast-forming agent and (e) HCHO (releasing agent) or (3) 4-24 pts. wt. of an aminoplast precondensate.

(I) is obtd. from (a) 10-90 wt.% of a diphenyl ether opt. substd. by CH_3, (b) 90-10 wt.% of a phenol opt. substd. by CH_3, the sum of (a) and (b) being 1 mol., and (c) 1-2 mols, calculated as sulphonic acid, of a sulphonating agent.

Prodn. comprises (i) reacting (a), (b) and (c) at 110-
180°C, (ii) reacting (a) with (c) at 110-120°C and then w
(b) at 110-180°C or (iii) reacting (b) with (c) at 110-120°
and then with (a) at 110-180°C to give (I). (I) is then rea
ed at 60-95°C with (2) or (3), and (in)organic base is ad
ed and then an organic acid is added. 11.4.77 as 786161
(8pp992).

Mfg. pure solns. of natural aminoacid(s) - by ultrafiltration then electrodialysis of liq. hydrolysate of biological proteinaceous material
BERTIN & CIE 04.08.77-FR-024069
B05 C03 (06.04.79) A23j-01/04 A61k-31/19

Suitable source is fish refuse from fishing grounds, ports etc. Ultrafiltration removes proteins and degradation prods. of molecular mass > 25,000, or even 5,000 if necessary. Salts, e.g. chlorides are removed by electrodialysis. Higher yields and purity than by known process. Prod. is used as human or animal foodstuff.

In an example, fish guts and non-commercial fish were hydrolysed enzymatically and the hydrolysate was pasteurised at 90°C for 1 hr. in a medium at pH 3 (citric acid). The hydrolysate was centrifuged and the liq. phase ultrafiltered to give a fraction with a threshold of ⩽ 10,000 for molecular mass. The filtrate, 1/5 to 1/6 vol. of the concentrate was collected, assayed from protein, peptide etc. (Sørenson) and treated with sodium lauryl sulphate at 80°C, then filtered (0.22μm pore size). The ppte. was discarded and the filtrate was electrodialysed until the salt concn. was about 100 ppm. The soln. may be concd. by inverse osmosis to give a prod. of 66 g./l. or by evapn. under reduced press. at < 60°C. 4.8.77 as 024069. (8pp288)

SALI- ★ D13 35718B/19 ★FR 2399-217
Non-proteinaceous nitrogen-based cattle lick - contains conc. residues from wine and cider mfr.
CIE SALINS MIDI EST 03.08.77-FR-023956
C03 (06.04.79) A23k-01/17

Licking block, for ruminants contg. 1-60% of non-protein nitrogen, also contains a cpd. from concentrates from distillation of wine, by-prods. of wine-making and cider-making, notably sugars, glycerol, tartaric acid and its salts, tannins and anthocyanins.

Consisting of hardness of block is improved to give correct supply of nitrogen to cattle, etc., e.g. ⩾ 11.5 g./100 kg. body weight of nitrogen daily. Magnesium, present as hydroxide, salts etc., improves absorption of non-proteinaceous nitrogen. Citric acid present in the residues prevents deposition of insoluble Mg salts; anthocyanins present have bactericidal, provitamin and antitumour properties. 3.8.77 as 023956. (7pp288)

Rotary drum pre-cooker for corn prod. - coats corn with oil to prevent loss of flavour, colour and vitamin(s)
BON R 03.08.77-FR-024570
(06.04.79) A23l-01

The pre-cooking cylinder comprises a horizontal, cylindrical, rotary drum through which the prod. is conveyed. The drum rotates coaxially inside a cylindrical, fixed casing fitted with heaters to cook the corn. Oil is dispersed on to the prod. from a supply tank, the coating action being assisted by agitator blades on the drum interior.

Prior to reaching the precooking cylinder, the hard corn is drawn from a supply silo and pref. passes through

milling and winnowing. The prod. delivered from the r
ary drum is pref. passed through another winnower.
Used for mfr. of Boulgour' corn prod. The prod. r
tains the attractive colour of hard corn, loses none of it
flavour and scarcely any of its vitamin content. 3.8.7

COLG ★ D21 35477B/19 ★DT 2747-852
Dentifrice with improved cleansing and polishing action - contg. abrasive agent together with zinc cpd. to reduce abrasion of dental enamel
COLGATE PALMOLIVE CO 26.10.77-DT-747852
E37 (03.05.79) A61k-07/16

Dentifrice with improved cleansing and polishing properties contains ≥ 1 abrasive agent with a particle dia. of 1-15 μ, and a non-toxic Zn cpd. in an amt. of ≥ 0.0065 wt.%. The abrasive agent is either (a) Ca pyrophosphate in an amt. of ≥ 7.5 wt.% or (b) a hard abrasive agent selected from calcined Al_2O_3, Zr, silicate, crystalline SiO_2, Ca silicate, $KAlSi_3O_8$, sand, SiC, pumice, ilmenite, CeO_2, Fe_2O_3, ZrO_2, SnO_2 and topaz in an amt. to give the dentifrice a radioactively determined enamel abrasion (REA) value of ≥ 400.

When the abrasive is Ca pyrophosphate, the Zn cpd. is ZnO and is pre-mixed with the Ca pyrophosphate before incorporating into the dentifrice. When the abrasive is Zr silicate or crystalline SiO_2, the Zn cpd. is $ZnCl_2$ and/or ZnO.

Incorporation of a Zn cpd. reduces the effect of the abrasive agent on the dental enamel without adversely affecting its effectiveness in removing resistant flecks and food residues from the tooth surface, so that a good polishing and cleansing effect is obtd. without the risk of damage to the enamel. 26.10.77 as 747852 (32pp280)

LIOC ★ D21 35643B/19 ★DT 2845-822
Caries-preventing dental treatment compsn. - contains acid, and stannous salt and fluoride salt in controlled fluoride to stannous ion mole ratio
LION DENTIFRICE KK 20.10.77-JA-126102
B06 E32 (03.05.79) A61k-05 A61k-33/24

Dental treatment compsn. contains an Sn (II)-salt, a water-sol. fluoride salt and an edible acid, to set pH 2-4. Sn(II)-salt quantity ranges from 0.07 wt.%, calculated as Sn (II)-ions and w.r.t. total compsn., up to saturation in water. Mol. ration $F^-:Sn^{2+}$ ions in aq. medium is 3.2 : 1 to 7:1.

The compsns. may be dentifrices, toothpastes, fillings, gels for ultrasonic treatment, mouth-washes, prophylactic pastes, dental floss, - powder and - desensitisers. The compsn. inhibit dental caries and maintain their activity also without repeated use. The Sn^{2+} ions are present in a stable, easily available condition. The acid solubility of the dental enamel is reduced. A difficulty soluble film or deposit is formed on teeth surface, e.g. contg. 15000 ppm F^- down to a depth of 3μ. Dental enamel surface can reach Vickers harness 280-290, compared with 80 for controls. 20.10.78 as 845822 (56pp)

A96 G02 (A14 A82) (24.04.79) A61k-05

Protective and cosmetic dental coating compsn. for restoring enamel defects and for repairing artificial teeth (including chipped acrylic or porcelain veneers) consists of: (a) a liq. opt. substd. acrylate resin (I); (b) a finely divided (equiv. spherical dia. 0.2-20(μm) particulate filler (II); (c) curing ingredients (III) including a peroxide-type initiator and an accelerator; and (d) an ultraviolet absorber (IV).

(I) is (i) a blend contg. 20-90% by wt. of an aromatic or cycloaliphatic-diacrylate, dimethacrylate, polyacrylate, or polymethacrylate, with ≮10% by wt. of an aliphatic tri-, di-, or mono-acrylate or methacrylate, and/or (ii) a homopolymerisable hydrogenated aromatic diacrylate or dimethacrylate (total amt. of aromatic or cycloaliphatic di(meth)acrylate ≯ 90% of (I).

(II) is a mixt. of 1-20% by wt. of filler of a fluorescent inorganic metal oxide pigment, and 80-99% of non-flourescent inorganic filler. Amt. of (III) used effects curing of the mixt. in 0.5-10 min. Amt. of (II) used is 30-70% by wt. of compsn. (< 50% by vol.). The density and vol. of (II) is so that compsn. is flowable but does not drip or run.

Flowable, paint-on compsn. can be applied to tooth surfaces and will flow to a feather edge, but dripping and running does not occur. Cured compsns. have excellent vitality and cosmetic appearance, and appear natural under UV light. In addn., staining on ageing, or with tea, coffee, and nicotine does not occur. 13.9.77 as 832927 (10pp478).

Pressure casting of dental restorations in investment cavity - positioned beneath crucible contg. molten material heated by arc electrodes to eliminate oxygen in purge gas

EMERICK H C 05.01.78-US-867115 (07.04.77-US-785495)
M22 P53 (24.04.79) B22d-21/02 B22d-27/02

Dental castings are made using a porous casting investment mould which is in fluid-tight communication with an overheat crucible having a bottom opening that registers with the mould cavity. A compressed gas is used to purge the crucible and the investment mould and the casting material is rapidly heated to cause it to flow into the crucible opening. Compressed gas is then admitted to the crucible above the molten material to force the material through the opening and into the cavity. The casting material is heated by an electric arc of C rich electrodes.

Used for casting of metal alloys for the manufacture of dental restorations, such as crowns and bridges. The oxygen component of the air enveloping the casting alloy is eliminated during melting and while it is forced under pressure into the cavity so as to prevent oxidn. and contamination of the casting. A positive pressure is exerted on the molten alloy to change the cavity rapidly and prevent premature cooling and incomplete casting. The mould may be rapidly positioned and charged. The castings have sharp features and no internal porosity. 5.1.78 as 867115 (7pp1044).

ALKU D21 31945B/17 =US 4151-001

Natural beeswax substitute compsn. - obtd. from a difunctional aliphatic acid, aliphatic alcohol and glycol

AKZONA INC 11.10.77-US-841261
*A25 (A96 D23) (24.04.79) *EP---1-471 +C08l-91/06*

Compsn. useful as a substitute for natural beeswax, comprises the reaction prod. obtd. by reacting under esterification conditions, (a) a difunctional 7-36C aliphatic acid; (b) a 10-22Caliphatic alcohol; and (c) glycolic cpd. (I).

(I) is ethylene glycol, propylene glycol, polyoxyethylene glycol of mol.wt. 100-1500 or polyoxypropylene glycol of mol.wt. 150-1025. Reactants are present in an amt. such that the number of acid functionalities is approximately equal to the number of hydroxyl functionalities. The alcohol and glycolic cpds. each supply ≥10% of the hydroxyl functionalities present. Reaction is continued until the reaction mixt. has attained an acid value of 10-30.

Prod. may be mixed with other esters, or with a minor amt. of natural beeswax. 11.10.77 as 841261 (6pp936).

Decolourising, deodorising agent prodn. from soft stone material - by grinding, compression moulding resulting powder and firing; used for industrial waste treatment
SHINOZAKI M 07.09.77-JA-107369
J01 (02.04.79) B01d-15 B01d-53/02

Soft stone material of stuff such as "Oya-stone" is ground and powdered, then compression moulded under (normal) pressure and fired at the temp. of ca. 150-300°C.

By throwing the product into industrial waste water etc. stinking material from fish processes, animal wastes, etc. and coloured materials such as pigments and dyes (which cause water pollution) can be adsorbed and removed effectively. As this product can be produced as a standard product in a large scale, handling and transportation is easy.

Specifically cutting waste obtd. when "Oya-stone" is cut in a stonepit etc. is ground to $\leq$100 mesh, and the compression moulding is effected at (normal) pressure. In the case of "normal pressure" the water content of the obtd. powder ($\leq$100 mesh) is adjusted to ca. 25-30% before moulding, and in the case of "under pressure" the water content of the powder ($\leq$100 mesh) is adjusted to ca. 15-20%, before moulding under pressure of 100 kg./cm.^{2} 7.9.77 as 107369 (2pp55)

ASAE ★ D23 36115B/19 ★J5 4041-906

Palm oil purificn. - by treating with oxalic acid and adsorbent, removing adsorbent and insolubles and steam-distilling

ASAHI ELECTROCHEM IND KK 09.09.77-JA-108419
(03.04.79) C11b-03

Crude palm oil is treated with oxalic acid, then with an adsorbent. The adsorbent and insolubles are then removed from the oil prod., and the prod. is steam distilled in vacuo to remove free fatty acid and odour.

Prod. has superior hue and preservability.

In an example, 200 g. palm oil having acid value of 4.0 and peroxide value of 4.7 was mixed with 0.2 wt.% oxalic acid, at 65°C. for 12 min. under 10 mm.Hg reduced pressure. 2 wt.% acid treated clay was then added to the mixt., and threated at 85°C. under 20 mm.Hg reduced pressure for 25 min. The prod. was filtered by reduced pressure to remove the acid treated clay and insolubles. Steam was blown into the obtd. oil at 250°C. for 1 hr.continuously under 25 mm.Hg reduced pressure. The oil was thus distilled and the hue of the obtd. palm oil was 0.2 red, and 2.3 yellow, using 2 inch glass cell according to the "Standard Method for Analysis of Oil and Fat". And the AOM value was 85 hr. 9.9.77 as 108419 (3pp126)

Carvone prepn. - by thermal dehydration of 1-methyl-1-hydroxy-4 isopropenyl-2-cyclohexanone

SHELL INT RES MIJ BV 19.10.77-GB-043499

E15 (23.04.79) C07c-45 C07c-49/48

Prepn. of carvone (I) is carried out by thermal dehydration of 1-methyl-1-hydroxy-4-isopropenyl-2-cyclohexanone (II) at 150-350°C(200-300°C, esp. 250-280°C).

Dehydration is pref. effected by passing a mixt. of (II) and an inert diluent through a heated tube. (II) is pref. prepd. by reacting d-limonene with nitrosylsulphuric acid (III) in 50-90 wt. % H_2SO_4 at -20 to +10°C, opt. in the presence of H_3PO_4; hydrolysing the resulting limonene nitrosylsulphate with H_2O to form 1-methyl-1-hydroxy-2-hydro-xyimino-4-isopropenylcyclohexane (IV); and treating the product with an alkali metal bisulphite at 40-70°C in anhydrous MeOH or EtOH.

The process gives high yields of (I) with high purity; e dehydration of (II) prepd. from d-limonene gives l-carvone with a specific rotation of ⩾-60°. 16. 10. 78 as 01035 (11pp367)

D24: SOAP; SOAP DETERGENTS

SHIS ★ D24 36116B/19 ★J5 4041-908
Transparent soap prepn. - by adding carboxylic acid of five-member ring cpd. e.g. pyrrolidone to transparent anhydrous soap glue, solidifying, cutting, etc.
SHISEIDO KK 09.09.77-JA-108412
E13 (E12) (03.04.79) C11d-13

Transparent soap is prepd. by adding 1.5-12.0 wt.% (based on 100 wt.% anhydrous prod. of the transparent soap glue) carboxylic acid type 5-membered ring cpd. to the transparent anhydrous soap glue, to obtain a transparent soap which can be solidified by cooling, cut, dried, shaped, and packaged in a short time after perfuming addn.

The coagulating temp. of the transparent soap glue is elevated, and the hardness after it is solidified is elevated. Time for the prepn. is reduced because the prod.attains to the proper transparency and hardness in a short time. Pref. carboxylic acid is 2-pyrrolidone-5-carboxylic acid (salt), 2-pyrrolidone-4-methyl-5-carboxylic acid (salt), 2-pyrrolidone-4-methyl-5-carboxylic acid (salt), 1-methyl-2-pyrrolidone-5-carboxylic acid (salt), DL-proline, L-hydroxyproline, L-histidine, etc. 9.9.77 as 108412 (5pp126)

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

MANUAL CODE INDEX

IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishe accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the norma DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

UYRA- 04.08.77 RAMOT UNIV APP RES A96 B04 D16 (A11 A14) =FR 2399-442
Isocyanide derivs. of poly:hydroxy polymers - 14479B/08

VARO- 04.08.77 VAROSEPITESI TUDOMA D15 =FR 2399-384
Biological surface water purificn. - 14435B/08
*VENZ/ 26.07.76 VENZO D D11 *US 4150-935
Appts. for automatically cutting and rolling cannoli - 36910B/19
VEOS 02.03.77 VER OSTERR EISEN & STAHL D15 M12 =DL -134-077
Neutralising acid contg. liquors esp. metal cleaning liquors - 49760A/28
*VERN- 01.08.77 VERNIERS SA D16 E24 *FR 2399-467
Betalaine colourant prodn. from beet juice - 35748B/19
*VOSG/ 01.08.77 VOSGANIANTZ J J D23 E17 *FR 2399-239
Solid perfume compsn. contg. alkali soap gelling agent - 35722B/19
VUKE/ 10.12.76 VUKELIC B D17 =US 4151-004
Sugar cane milling roll unit - 58810A/33
VZUI/ 21.10.77 VAN ZUILICHEM D J D13 =NL 7807-872
Shelling cocoa pods by IR irradiation - 31580B/17

*WACH/ 28.10.77 WACHTEL S D22 E24 G04 *DL -134-191
Indicator for testing hot air sterilisation esp. for medicines - 35336B/19
*WARN 09.09.77 NIPPON WARNER LAMBE A97 D13 *J5 4041-364
Chewing gum compsn. with no sucrose and/or glucose - 36019B/19
WASS- 22.12.71 INST WASSERWIRTSCHA D15 =DL --94-329
Water oxygenator/chemical treatment plant - 11179U/09
*WATE- 06.10.77 WATER PURIFICATION D15 J01 *US 4151-084
Lamella separator for solids-contg. liq. - 36978B/19
WELC- 13.09.77 WELCH FOODS INC B07 D13 E24 (B04 D21) =GB 2006-802
Anthocyanin pigment recovery from plant materials - 24208B/13
*WERN 07.07.78 WERNER & PFLEIDERER D11 *DS 2829-937
Air circulation baking oven - 35447B/19
*WESI 07.06.76 WEST LABORATORIES INC A96 D22 E36 (A14) *US 4151-275
Stabilised iodine tincture - 37079B/19
WESS 17.08.76 WESTFALIA SEPARATOR AG D13 =DS 2636-882
Continuous mfr. of cream cheese from skimmed milk - 90107Y/51
*WIBA 11.09.78 WIBAU GMBH D15 *DS 2839-410
Scavenger for floating matter in sewage settling tank - 35449B/19
*WILL/ 08.11.76 WILLIAMS M A D13 *US 4151-306
Hydrolysis of keratin-contg. materials - 37089B/19
*WINK 02.11.77 FR WINKLER KG D11 *DT 2748-959
Dough dividing machine - 35578B/19
*WINK 02.11.77 FR WINKLER KG D11 *DT 2748-988
Dough dividing machine ejecting several portions simultaneously -

•WOLF/ 29.11.77 WOLF F A97 D18 (A11) *DL -134-190
Retaining moisture in e.g. tobacco using carboxy methycellulose - 35335B/19
WORL- 29.08.77 WORLD DEV LABS D15 J01 =BR 7805-596
Reducing impurity concn. of solution by reverse osmosis - 18520B/10
WRIL 26.09.77 WRIGLEY W JR CO D13 E17 =US 4151-270
Chewing gum for stimulating saliva flow, esp. for athletes - 65304A/37

•YABU/ 10.09.77 YABUTA K D15 M11 *J5 4042-363
Treatment of sludge contg. heavy metals - 36209B/19
•YAWA/ 10.09.77 YAWATA M D15 J01 *J5 4042-365
Liq. evaporation appts. - 36211B/19
YOKI- 13.12.71 YOKIJIRUSHI NYOGYO D13 =J7 9008-737
Yogurt prepn - 74861U/49

ZAID 01.10.71 MICROBIAL CHEM RES FOUND B05 D16 =J7 9008-747
New antibiotic - 52956U/37
ZAID 15.03.77 ZAIDAN HOJIN BISEIB B04 D16 =US 4151-347
Isolation of coformycin and related cpds. from aq. soln. - 92049A/51
•ZENK- 02.09.77 ZENKOKU TSUKEMONO K D13 *J5 4041-348
Prodn. of pickle - 36014B/19
